# Package 'Compositional'

September 2, 2021

Type Package
Title Compositional Data Analysis
Version 4.9
Date 2021-09-02

Author Michail Tsagris [aut, cre], Giorgos Athineou [aut], Abdulaziz Alenazi [ctb]

Maintainer Michail Tsagris <mtsagris@uoc.gr>

**Depends** R (>= 4.0)

**Imports** codalm, Directional, doParallel, emplik, FlexDir, foreach, glmnet, MASS, mda, mixture, NlcOptim, nnet, parallel, pchc, RANN, Rfast, Rfast2, sn, stats

**Description** Regression, classification, contour plots, hypothesis testing and fitting of distributions for compositional data are some of the functions included.

The standard textbook for such data is John Aitchison's (1986) ``The statistical analysis of compositional data". Relevant papers include:

- a) Tsagris M.T., Preston S. and Wood A.T.A. (2011). A data-based power transformation for compositional data. Fourth International International Workshop on Compositional Data Analysis.

Comp	ositional-package Compositional Data Analysis

# Description

A Collection of Functions for Compositional Data Analysis.

# **Details**

Package: Compositional

Type: Package Version: 4.9

Date: 2021-09-02 License: GPL-2

# Maintainers

Michail Tsagris <mtsagris@uoc.gr>

# Note

Acknowledgments:

Michail Tsagris would like to express his acknowledgments to Professor Andy Wood and Dr Simon Preston from the university of Nottingham for being his supervisors during his PhD in compositional data analysis. We would also like to express our acknowledgments to Profesor Kurt Hornik (and also the rest of the R core team) for his help with this package. Manos Papadakis, undergraduate student in the department of computer science, university of Crete, is also acknowledged for his programming tips. Ermanno Affuso from the university of South Alabama suggested that I have a default value in the "mkde"" function. Van Thang Hoang from Hasselt university spotted a bug in the "js.compreg" function and is greatly acknowledged for that. Claudia Wehrhahn Cortes spotted a bug in the "diri.reg"" function and she is greatly acknowledged for that. Philipp Kynast from Bruker Daltonik GmbH found a mistake in the function "mkde" which is now fixed. Jasmine Heyse from the university of Ghent spotted a bug in the function "kl.compreg" which is now fixed.

#### References

Aitchison J. (1986). The statistical analysis of compositional data. Chapman & Hall.

```
All pairwise additive log-ratio transformations

All pairwise additive log-ratio transformations
```

### **Description**

All pairwise additive log-ratio transformations.

#### **Usage**

```
alr.all(x)
```

#### **Arguments**

Χ

A numerical matrix with the compositional data.

#### **Details**

The additive log-ratio transformation with the first component being the commn divisor is applied. Then all the other pairwise log-ratios are computed and added next to each column. For example, divide by the first component, then divide by the second component and so on. This means that no zeros are allowed.

#### Value

A matrix with all pairwise alr transformed data.

#### Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

#### References

Aitchison J. (1986). The statistical analysis of compositional data. Chapman & Hall.

x <- x / rowSums(x)
y <- alr.all(x)</pre>
```

Alpha generalised correlations between two compositional datasets  $Alpha \ generalised \ correlations \ between \ two \ compositional \ datasets$ 

# Description

Alpha generalised correlations between two compositional datasets.

# Usage

```
acor(y, x, a, type = "dcor")
```

#### **Arguments**

у	A matrix with the compositional data.
X	A matrix with the compositional data.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied. If more than one values are supplied the distance or canonical correlation are computed for all values.
type	the type of correlation to compute, the distance correlation ("edist"), the canonical correlation ("cancor") or "both".

### **Details**

The  $\alpha$ -transformation is applied toe ach composition and then the distance correlation or the canonical correlation is computed. If one value of  $\alpha$  is supplied the type="cancor" will return all eigenvalues. If more than one values of  $\alpha$  are provided then the first eigenvalue only will be returned.

#### Value

A vector or a matrix depending on the length of the values of  $\alpha$  and the type of the correlation to be computed.

# Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

#### See Also

```
acor.tune,alfa.profile,alfa,alfainv
```

# Examples

```
y <- rdiri(30, runif(3) )
x <- rdiri(30, runif(4) )
acor(y, x, a = 0.4)</pre>
```

ANOVA for the log-contrast regression versus the uncostrained log-contrast regression  $ANOVA \ for \ the \ log-contrast \ regression \ versus \ the \ uncostrained \ log-contrast \ regression$ 

# **Description**

ANOVA for the log-contrast regression versus the uncostrained log-contrast regression.

# Usage

```
lcreg.aov(mod0, mod1)
```

# **Arguments**

mod0 The log-contrast regression model. The object returned by lc.reg.

mod1 The unconstrained log-contrast regression model. The object returned by ulc.reg.

# **Details**

An F-test is performed to test the zero-to-sum constraints of the regression coefficients.

#### Value

A vector with two vaues, the F-statistic and its associated p-value.

#### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

#### See Also

```
lc.reg,ulc.reg,alfa.pcr,alfa.knn.reg
```

# **Examples**

```
y <- iris[, 1]
x <- as.matrix(iris[, 2:4])
x <- x / rowSums(x)
mod0 <- lc.reg(y, x)
mod1 <- ulc.reg(y, x)
lcreg.aov(mod0, mod1)</pre>
```

Bayesian network learning with compositional data

Bayesian network learning with compositional data

# **Description**

Bayesian network learning with compositional data.

# Usage

```
compbn(x, type = "fedhc", max_k = 3, alpha = 0.05, robust = FALSE,
ini.stat = NULL, R = NULL, restart = 10, tabu = 10, score = "bic-g",
blacklist = NULL, whitelist = NULL)
```

# **Arguments**

X	A numerical matrix with the compositional data. They can be either the logged compositional or the centred log-ratio transformed compositional data. We leave this open to the user.
type	This can be either "fedhc", "pchc", "mmhc", "fedtabu", "pctabu" or "mmtabu".
max_k	The maximum conditioning set to use in the conditional indepedence test (see Details). Integer, default value is 3
alpha	The significance level for assessing the p-values.
robus	Do you want outliers to be removed prior to applying the algorithms? If yes, set this to TRUE to utilise the MCD.
ini.s	If the initial test statistics (univariate associations) are available, pass them through this parameter.
R	If the correlation matrix is available, pass it here.

restart An integer, the number of random restarts.

tabu An integer, the length of the tabu list used in the tabu function.

score A character string, the label of the network score to be used in the algorithm. If

none is specified, the default score is the Bayesian Information Criterion. Other available scores are: "bic-g" (default), "loglik-g", "aic-g", "bic-g" or "bge".

blacklist A data frame with two columns (optionally labeled "from" and "to"), containing

a set of arcs not to be included in the graph.

whitelist A data frame with two columns (optionally labeled "from" and "to"), containing

a set of arcs to be included in the graph.

#### **Details**

The FEDHC algorithm is implemented. The FBED algorithm (Borboudakis and Tsamardinos, 2019), without the backward phase, is implemented during the skeleton identification phase. Next, the Hill Climbing greedy search or the Tabu search is employed to score the network.

The PC algorithm as proposed by Spirtes et al. (2001) is first implemented followed by a scoring phase, such as hill climbing or tabu search. The PCHC was proposed by Tsagris (2021), while the PCTABU algorithm is the same but instead of the hill climbing scoring phase, the tabu search is employed.

The MMHC algorithm is implemented without performing the backward elimination during the skeleton identification phase. The MMHC as described in Tsamardinos et al. (2006) employs the MMPC algorithm during the skeleton construction phase and the Tabu search in the scoring phase. In this package, the mmhc function employs the Hill Climbing greedy search in the scoring phase while the mmtabu employs the Tabu search.

#### Value

A list including:

ini A list including the output of the mmhc.skel function.

dag A "bn" class output. A list including the outcome of the Hill-Climbing or the

Tabu search phase. See the package "bnlearn" for more details.

scoring The score value.

runtime The duration of the algorithm.

Beta regression

Beta regression

# Description

Beta regression.

#### Usage

```
beta.reg(y, x, xnew = NULL)
```

### **Arguments**

У	The response variable. It must be a numerical vector with proportions excluding 0 and 1.
X	The indendent variable(s). It can be a vector, a matrix or a dataframe with continuous only variables, a data frame with mixed or only categorical variables.
xnew	If you have new values for the predictor variables (dataset) whose response values you want to predict insert them here.

#### **Details**

Beta regression is fitted.

#### Value

A list including:

phi The estimated precision parameter.

info A matrix with the estimated regression parameters, their standard errors, Wald

statistics and associated p-values.

loglik The log-likelihood of the regression model. est The estimated values if xnew is not NULL.

beta.reg(y, x)</pre>
```

Choose the number of principal components via reconstruction error  ${\it Choose \ the \ number \ of \ principal \ components \ via \ reconstruction \ error}$ 

# **Description**

Choose the number of principal components via reconstruction error.

#### Usage

```
choose.pc(x, plot = TRUE)
```

# Arguments

x A numerical matrix with more rows than columns.

plot Should the plot of the PRESS values appear? Default value is TRUE.

#### **Details**

The functions allows for selecting the number of eigenvectors via the reconstruction error which is computed for all eigenvectors based on SVD.

#### Value

A list including:

values The eigenvalues of the covariance matrix.

cumprop The cumulative proportion of the eigenvalues of the covariance matrix.

per The differences in the cumulative proportion of the eigenvalues of the covariance

matrix.

press The reconstruction error  $\sqrt{\sum_{ij}{(x_{ij}-\hat{x}_{ij})^2}}$  for each number of eigenvectors.

runtime The runtime of the algorithm.

a <- choose.pc(x, plot = FALSE)</pre>
```

Constrained linear least squares for compositional responses and predictors  $Constrained\ linear\ least\ squares\ for\ compositional\ responses\ and\ predictors$ 

#### **Description**

Constrained linear least squares for compositional responses and predictors.

### Usage

```
ols.compcomp(y, x, rs = 5, tol = 1e-4, xnew = NULL)
```

### **Arguments**

У	A matrix with the compositional data (dependent variable). Zero values are allowed.
Х	A matrix with the compositional predictors. Zero values are allowed.
rs	The number of times to run the constrained optimisation using different random starting values each time.
tol	The threshold upon which to stop the iterations of the constrained optimisation.
xnew	If you have new data use it, otherwise leave it NULL.

#### **Details**

The function performs least squares regression where the beta coefficients are constained to be positive and sum to 1. We were inspired by the transformation-free linear regression for compositional responses and predictors of Fiksel, Zeger and Datta (2020).

#### Value

A list including:

runtime The time required by the regression.

mse The mean squared errors. be The beta coefficients.

est The fitted of xnew if xnew is not NULL.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

```

Contour plot of the alpha multivariate normal in S^2 Contour plot of the  $\alpha$  multivariate normal in S^2

#### **Description**

Contour plot of the  $\alpha$  multivariate normal in  $S^2$ .

# Usage

```
alfa.contour(m, s, a, n = 100, x = NULL)
```

# **Arguments**

m	The mean vector of the $\alpha$ multivariate normal model.
s	The covariance matrix of the $\alpha$ multivariate normal model.
a	The value of a for the $\alpha$ -transformation.
n	The number of grid points to consider over which the density is calculated.
x	This is either NULL (no data) or contains a 3 column matrix with compositional data.

#### **Details**

The  $\alpha$ -transformation is applied to the compositional data and then for a grid of points within the 2-dimensional simplex, the density of the  $\alpha$  multivariate normal is calculated and the contours are plotted.

#### Value

The contour plot of the  $\alpha$  multivariate normal appears.

#### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

x <- x / rowSums(x)
a <- a.est(x)$best
mod <- alpha.mle(x, a)
fold.contour(mod$mu, mod$su, mod$p, a)</pre>
```

```
Contour plot of the alpha-folded model in S^2 
 Contour\ plot\ of\ the\ \alpha\mbox{-}folded\ model\ in\ S^2
```

#### **Description**

Contour plot of the  $\alpha$ -folded model in  $S^2$ .

#### Usage

```
fold.contour(m, s, p, a, n = 100, x = NULL)
```

# **Arguments**

m	The mean vector of the folded model.
s	The covariance matrix of the folded model.
р	The probability inside the simplex of the folded model.
а	The value of a for the $\alpha$ -transformation.
n	The number of grid points to consider over which the density is calculated.
х	This is either NULL (no data) or contains a 3 column matrix with compositional data.

#### **Details**

The  $\alpha$ -transformation is applied to the compositional data and then for a grid of points within the 2-dimensional simplex the folded model's density is calculated and the contours are plotted.

#### Value

The contour plot of the folded model appears.

```

```
Contour plot of the Dirichlet distribution in S^2 
 Contour plot of the Dirichlet distribution in S^2
```

# Description

Contour plot of the Dirichlet distribution in  $S^2$ .

# Usage

```
diri.contour(a, n = 100, x = NULL)
```

# **Arguments**

- a A vector with three elements corresponding to the 3 (estimated) parameters.
- n The number of grid points to consider over which the density is calculated.
- x This is either NULL (no data) or contains a 3 column matrix with compositional data.

#### **Details**

The user can plot only the contour lines of a Dirichlet with a given vector of parameters, or can also add the relevant data should he/she wish to.

#### Value

A ternary diagram with the points and the Dirichlet contour lines.

#### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr> and Giorgos Athineou <gioathineou@gmail.com>.

Contour plot of the Flexible Dirichlet distribution in S^2 Contour plot of the Flexible Dirichlet distribution in S^2

# **Description**

Contour plot of the Flexible Dirichlet distribution in  $S^2$ .

# Usage

```
fd.contour(alpha, prob, tau, n = 100, x = NULL)
```

# **Arguments**

alpha	A vector of the non-negative $\alpha$ parameters.
prob	A vector of the clusters' probabilities. It must sum to one.
tau	The non-negative scalar $tau$ parameter.
n	The number of grid points to consider over which the density is calculated.
x	This is either NULL (no data) or contains a 3 column matrix with compositional
	data.

#### **Details**

The user can plot only the contour lines of a Dirichlet with a given vector of parameters, or can also add the relevant data should they wish to.

#### Value

A ternary diagram with the points and the Flexible Dirichlet contour lines.

#### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

# **Examples**

```
## Not run:
x <- rfd(n = 50, a = c(12, 11, 10), p = c(0.25, 0.25, 0.5), tau = 4 )
mod <- fd.est(x, ini.iter = 10, final.iter = 20)
fd.contour(mod$alpha, mod$prob, mod$tau, x = x)
## End(Not run)</pre>
```

Contour plot of the Gaussian mixture model in S^2  ${\it Contour\ plot\ of\ the\ Gaussian\ mixture\ model\ in\ S^2}$ 

# **Description**

Contour plot of the Gaussian mixture model in  $S^2$ .

### Usage

```
mixnorm.contour(x, type = "alr", mod)
```

#### **Arguments**

x A matrix with the compositional data.

type The type of trasformation used, either the additive log-ratio ("alr"), the isometric

log-ratio ("ilr") or the pivot coordinate ("pivot") transformation.

An object containing the output of a mix.compnorm model.

# Details

The contour plot of a Gaussian mixture model is plotted. For this you need the data and the fitted model.

#### Value

A ternary plot with the data and the contour lines of the fitted Gaussian mixture model.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

# References

## Not run:
x <- as.matrix(iris[, 1:3])
x <- x / rowSums(x)
mod <- mix.compnorm(x, 3, model = "EII")
mixnorm.contour(x, "alr", mod)
## End(Not run)</pre>
```

```
Contour plot of the Kent distribution in S^2 {\it Contour\ plot\ of\ the\ Kent\ distribution\ in\ S^2}
```

# **Description**

Contour plot of the Kent distribution in  $S^2$ .

#### Usage

```
kent.contour(G, param, n = 100, x = NULL)
```

# Arguments

G	A 3 x 3 matrix whose first column is the mean direction. The second and third
	columns are the major and minor axes respectively.
param	A vector with the concentration $kappa$ and ovalness $\beta$ parameters (the $\psi$ parameter has been absorbed inside the matrix G).
n	The number of grid points to consider over which the density is calculated.
X	This is either NULL (no data) or contains a 3 column matrix with compositional data.
	uala.

#### **Details**

The user can plot only the contour lines of a Dirichlet with a given vector of parameters, or can also add the relevant data should they wish to.

#### Value

A ternary diagram with the points and the Dirichlet contour lines.

#### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

#### References

#### **Examples**

```
G <- matrix( c(0.05713382, 0.96029716, 0.27306608, -0.98809661, 0.01525976, 0.15307588, 0.1428314, -0.2785615, 0.9497382), ncol = 3 ) param <- c(2361.8401338, 1171.3808172, 0.1435577) kent.contour(G, param)
```

```
Contour plot of the kernel density estimate in S^2 
 Contour plot of the kernel density estimate in S^2
```

#### Description

Contour plot of the kernel density estimate in  $S^2$ .

#### Usage

```
comp.kerncontour(x, type = "alr", n = 100)
```

# **Arguments**

x A matrix with the compositional data. It has to be a 3 column matrix.

type This is either "alr" or "ilr", corresponding to the additive and the isometric log-

ratio transformation respectively.

n The number of grid points to consider, over which the density is calculated.

#### **Details**

The alr or the ilr transformation are applied to the compositional data. Then, the optimal bandwidth using maximum likelihood cross-validation is chosen. The multivariate normal kernel density is calculated for a grid of points. Those points are the points on the 2-dimensional simplex. Finally the contours are plotted.

# Value

A ternary diagram with the points and the kernel contour lines.

```

```
Contour plot of the normal distribution in S^2 {\it Contour\ plot\ of\ the\ normal\ distribution\ in\ S^2}
```

# **Description**

Contour plot of the normal distribution in  $S^2$ .

#### Usage

```
norm.contour(m, s, type = "alr", n = 100, x = NULL)
```

### **Arguments**

m	The mean vector.
S	The covariance matrix.
type	The type of trasformation used, either the additive log-ratio ("alr"), the isometric log-ratio ("ilr") or the pivot coordinate ("pivot") transformation.
n	The number of grid points to consider over which the density is calculated.
х	This is either NULL (no data) or contains a 3 column matrix with compositional data.

#### **Details**

The alr or the ilr transformation is applied to the compositional data at first. Then for a grid of points within the 2-dimensional simplex the bivariate normal density is calculated and the contours are plotted along with the points.

#### Value

A ternary diagram with the points (if appear = TRUE) and the bivariate normal contour lines.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

Cross validation for some compositional regression models  $Cross\ validation\ for\ some\ compositional\ regression\ models$ 

# **Description**

Cross validation for some compositional regression models.

#### Usage

```
cv.comp.reg(y, x, type = "comp.reg", nfolds = 10, folds = NULL, seed = FALSE)
```

# Arguments

У	A matrix with compositional data. Zero values are allowed for some regression models.
X	The predictor variable(s).
type	This can be one of the following: "comp.reg", "robust", "kl.compreg", "js.compreg", "diri.reg" or "zadr".
nfolds	The number of folds to be used. This is taken into consideration only if the folds argument is not supplied.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
seed	If seed is TRUE the results will always be the same.

# **Details**

A k-fold cross validation for a compositional regression model is performed.

#### Value

A list including:

runtime The runtime of the cross-validation procedure.

kl The Kullback-Leibler divergences for all runs.

js The Jensen-Shannon divergences for all runs.

perf The average Kullback-Leibler divergence and average Jensen-Shannon diver-

gence.

Cross validation for the alpha-k-NN regression for compositional response data  ${\it Cross\ validation\ for\ the\ } \alpha\text{-}k\text{-}NN\ regression\ for\ compositional\ response}$  data

# Description

Cross validation for the  $\alpha$ -k-NN regression for compositional response data.

# Usage

```
aknnreg.tune(y, x, a = seq(0.1, 1, by = 0.1), k = 2:10, apostasi = "euclidean", nfolds = 10, folds = NULL, seed = FALSE, rann = FALSE)
```

#### **Arguments**

У	A matrix with the compositional response data. Zeros are allowed.
X	A matrix with the available predictor variables.
a	A vector with a grid of values of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
k	The number of nearest neighbours to consider. It can be a single number or a vector.
apostasi	The type of distance to use, either "euclidean" or "manhattan".
nfolds	The number of folds. Set to 10 by default.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
seed	If seed is TRUE the results will always be the same.
rann	If you have large scale datasets and want a faster k-NN search, you can use kd-trees implemented in the R package "RANN". In this case you must set this argument equal to TRUE. Note however, that in this case, the only available distance is by default "euclidean".

# **Details**

A k-fold cross validation for the  $\alpha$ -k-NN regression for compositional response data is performed.

# Value

A list including:

kl	The Kullback-Leibler divergence for all combinations of $\alpha$ and $k$ .
js	The Jensen-Shannon divergence for all combinations of $\boldsymbol{\alpha}$ and $\boldsymbol{k}.$
klmin	The minimum Kullback-Leibler divergence.
jsmin	The minimum Jensen-Shannon divergence.
kl.alpha	The optimal $\alpha$ that leads to the minimum Kullback-Leibler divergence.
kl.k	The optimal $\boldsymbol{k}$ that leads to the minimum Kullback-Leibler divergence.
js.alpha	The optimal $\boldsymbol{\alpha}$ that leads to the minimum Jensen-Shannon divergence.
js.k	The optimal $\boldsymbol{k}$ that leads to the minimum Jensen-Shannon divergence.
runtime	The runtime of the cross-validation procedure.

Cross validation for the regularised and flexible discriminant analysis with compositional data using Cross validation for the regularised and flexible discriminant analysis with compositional data using the  $\alpha$ -transformation

# Description

Cross validation for the regularised and flexible discriminant analysis with compositional data using the  $\alpha$ -transformation.

# Usage

```
alfarda.tune(x, ina, a = seq(-1, 1, by = 0.1), nfolds = 10, gam = seq(0, 1, by = 0.1), del = seq(0, 1, by = 0.1), ncores = 1, folds = NULL, stratified = TRUE, seed = FALSE)

alfafda.tune(x, ina, a = seq(-1, 1, by = 0.1), nfolds = 10, folds = NULL, stratified = TRUE, seed = FALSE, graph = FALSE)
```

#### **Arguments**

x	A matrix with the available compositional data. Zeros are allowed.
ina	A group indicator variable for the available data.
a	A vector with a grid of values of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
nfolds	The number of folds. Set to 10 by default.
gam	A vector of values between 0 and 1. It is the weight of the pooled covariance and the diagonal matrix.
del	A vector of values between 0 and 1. It is the weight of the LDA and QDA.
ncores	The number of cores to use. If it is more than 1 parallel computing is performed. It is advisable to use it if you have many observations and or many variables, otherwise it will slow down th process.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
stratified	Do you want the folds to be created in a stratified way? TRUE or FALSE.
seed	If seed is TRUE the results will always be the same.
graph	If graph is TRUE (default value) a filled contour plot will appear.

#### **Details**

A k-fold cross validation is performed.

Cross validation for the regularised and flexible discriminant analysis with compositional data using the alpha-transformation33

#### Value

For the alfa.rda a list including:

res The estimated optimal rate and the best values of  $\alpha$ , gamma and delta.

percent For the best value of  $\alpha$  the averaged over all folds best prates of correct clas-

sification. It is a matrix, where rows correspond to the  $\gamma$  values and columns

correspond to  $\delta$  values.

se The estimated standard errors of the "percent" matrix.

runtime The runtime of the cross-validation procedure.

For the alfa.fda a list including:

per The performance of the fda in each fold for each value of  $\alpha$ .

performance The average performance for each value of  $\alpha$ .

opt\_a The optimal value of  $\alpha$ .

runtime The runtime of the cross-validation procedure.

Cross validation for the ridge regression

Cross validation for the ridge regression

# **Description**

Cross validation for the ridge regression is performed. There is an option for the GCV criterion which is automatic.

#### Usage

```
ridge.tune(y, x, nfolds = 10, lambda = seq(0, 2, by = 0.1), folds = NULL, ncores = 1, seed = FALSE, graph = FALSE)
```

# **Arguments**

У	A numeric vector containing the values of the target variable. If the values are proportions or percentages, i.e. strictly within 0 and 1 they are mapped into R using the logit transformation.
X	A numeric matrix containing the variables.
nfolds	The number of folds in the cross validation.
lambda	A vector with the a grid of values of $\lambda$ to be used.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
ncores	The number of cores to use. If it is more than 1 parallel computing is performed.
seed	If seed is TRUE the results will always be the same.
graph	If graph is set to TRUE the performances for each fold as a function of the $\lambda$ values will appear.

# **Details**

A k-fold cross validation is performed. This function is used by alfaridge.tune.

#### Value

A list including:

msp The performance of the ridge regression for every fold.

mspe The values of the mean prediction error for each value of  $\lambda$ .

1ambda The value of  $\lambda$  which corresponds to the minimum MSPE.

performance The minimum MSPE.

runtime The time required by the cross-validation procedure.

Cross validation for the ridge regression with compositional data as predictor using the alpha-transformation35

x	A numeric matrix containing the compositional data, i.e. the predictor variables. Zero values are allowed.
nfolds	The number of folds in the cross validation.

36Cross validation for the ridge regression with compositional data as predictor using the alpha-transformation

a A vector with the a grid of values of  $\alpha$  to be used. 1 A vector with the a grid of values of  $\lambda$  to be used.

folds If you have the list with the folds supply it here. You can also leave it NULL

and it will create folds.

ncores The number of cores to use. If it is more than 1 parallel computing is performed.

It is advisable to use it if you have many observations and or many variables,

otherwise it will slow down th process.

graph If graph is TRUE (default value) a filled contour plot will appear.

col.nu A number parameter for the filled contour plot, taken into account only if graph

is TRUE.

seed If seed is TRUE the results will always be the same.

#### **Details**

A k-fold cross validation is performed.

#### Value

If graph is TRUE a fileld contour a filled contour will appear. A list including:

mspe The MSPE where rows correspond to the  $\alpha$  values and the columns to the num-

ber of principal components.

best.par The best pair of  $\alpha$  and  $\lambda$ .

performance The minimum mean squared error of prediction.
runtime The run time of the cross-validation procedure.

Cross validation for the transformation-free linear regression for compositional responses and predictors37

### **Examples**

```
library(MASS)
y <- as.vector(fgl[, 1])
x <- as.matrix(fgl[, 2:9])
x <- x / rowSums(x)
alfaridge.tune( y, x, nfolds = 10, a = seq(0.1, 1, by = 0.1),
lambda = seq(0, 1, by = 0.1) )</pre>
```

Cross validation for the transformation-free linear regression for compositional responses and prediction for the transformation-free linear regression for compositional responses and predictors

## **Description**

Cross validation for the transformation-free linear regression for compositional responses and predictors.

## Usage

```
cv.tflr(y, x, nfolds = 10, folds = NULL, seed = FALSE)
```

## Arguments

У	A matrix with compositional response data. Zero values are allowed.
x	A matrix with compositional predictors. Zero values are allowed.
nfolds	The number of folds to be used. This is taken into consideration only if the folds argument is not supplied.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
seed	If seed is TRUE the results will always be the same.

#### **Details**

A k-fold cross validation for the transformation-free linear regression for compositional responses and predictors is performed.

#### Value

A list including:

runtime The runtime of the cross-validation procedure.

kl The Kullback-Leibler divergences for all runs.

js The Jensen-Shannon divergences for all runs.

perf The average Kullback-Leibler divergence and average Jensen-Shannon divergence.

38 Cross-validation for the constrained linear least squares for compositional responses and predictors

### Author(s)

Michail Tsagris

## **Examples**

```
library(MASS)
y <- rdiri(214, runif(3, 1, 3))
x <- as.matrix(fgl[, 2:9])
x <- x / rowSums(x)
mod <- cv.tflr(y, x)
mod</pre>
```

## Description

Cross-validation for the constrained linear least squares for compositional responses and predictors.

### Usage

```
cv.olscompcomp(y, x, rs = 5, tol = 1e-4, nfolds = 10, folds = NULL, seed = FALSE)
```

### **Arguments**

У	A matrix with compositional response data. Zero values are allowed.
x	A matrix with compositional predictors. Zero values are allowed.
rs	The number of times to run the constrained optimisation using different random starting values each time.
tol	The threshold upon which to stop the iterations of the constrained optimisation.
nfolds	The number of folds to be used. This is taken into consideration only if the folds argument is not supplied.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
seed	If seed is TRUE the results will always be the same.

### **Details**

The function performs k-fold cross-validation for the least squares regression where the beta coefficients are constained to be positive and sum to 1.

#### Value

### A list including:

runtime The runtime of the cross-validation procedure.

kl The Kullback-Leibler divergences for all runs.

js The Jensen-Shannon divergences for all runs.

perf The average Kullback-Leibler divergence and average Jensen-Shannon divergence.

mod</pre>
```

Cross-validation for the Dirichlet discriminant analysis  ${\it Cross-validation\ for\ the\ Dirichlet\ discriminant\ analysis}$ 

### **Description**

Cross-validation for the Dirichlet discriminant analysis.

### Usage

```
cv.dda(x, ina, nfolds = 10, folds = NULL, stratified = TRUE, seed = FALSE)
```

### **Arguments**

x A matrix with th	e available data, t	he predictor variables.
--------------------	---------------------	-------------------------

ina A vector of data. The response variable, which is categorical (factor is accept-

able).

folds A list with the indices of the folds.

nfolds The number of folds to be used. This is taken into consideration only if "folds"

is NULL.

stratified Do you want the folds to be selected using stratified random sampling? This

preserves the analogy of the samples of each group. Make this TRUE if you

wish.

seed If you set this to TRUE, the same folds will be created every time.

### **Details**

This function estimates the performance of the Dirichlet discriminant analysis via k-fold crossvalidation.

### Value

A list including:

percent The percentage of correct classification

runtime The duration of the cross-validation proecdure.

## Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

x <- x / rowSums(x)
mod <- cv.dda(x, ina = iris[, 5] )</pre>
```

Cross-validation for the LASSO Kullback-Leibler divergence based regression  ${\it Cross-validation\ for\ the\ LASSO\ Kullback-Leibler\ divergence\ based\ regression}$ 

#### **Description**

Cross-validation for the LASSO Kullback-Leibler divergence based regression.

#### Usage

```
cv.lasso.klcompreg(y, x, alpha = 1, type = "grouped", nfolds = 10,
folds = NULL, seed = FALSE, graph = FALSE)
```

### **Arguments**

У	A numerical matrix with compositional data with or without zeros.
X	A matrix with the predictor variables.
alpha	The elastic net mixing parameter, with $0 \le \alpha \le 1$ . The penalty is defined as a weighted combination of the ridge and of the Lasso regression. When $\alpha = 1$ LASSO is applied, while $\alpha = 0$ yields the ridge regression.
type	<b>This information is copied from the package glmnet.</b> If "grouped" then a grouped lasso penalty is used on the multinomial coefficients for a variable. This ensures they are all in our out together. The default in our case is "grouped".
nfolds	The number of folds for the K-fold cross validation, set to 10 by default.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
seed	If seed is TRUE the results will always be the same.
graph	If graph is TRUE (default value) a filled contour plot will appear.

## **Details**

The K-fold cross validation is performed in order to select the optimal value for  $\lambda$ , the penalty parameter in LASSO.

### Value

The outcome is the same as in the R package glmnet. The extra addition is that if "graph = TRUE", then the plot of the cross-validated object is returned. The contains the logarithm of  $\lambda$  and the deviance. The numbers on top of the figure show the number of set of coefficients for each component, that are not zero.

y <- rdiri( 214, runif(4, 1, 3) )
x <- as.matrix( fgl[, 2:9] )
mod <- cv.lasso.klcompreg(y, x)</pre>
```

# Description

Cross-validation for the LASSO log-ratio regression with compositional response.

### Usage

```
cv.lasso.compreg(y, x, alpha = 1, nfolds = 10,
folds = NULL, seed = FALSE, graph = FALSE)
```

### **Arguments**

У	A numerical matrix with compositional data. Zero values are not allowed as the additive log-ratio transformation (alr) is applied to the compositional response prior to implementing the LASSO algorithm.
x	A matrix with the predictor variables.
alpha	The elastic net mixing parameter, with $0 \le \alpha \le 1$ . The penalty is defined as a weighted combination of the ridge and of the Lasso regression. When $\alpha=1$ LASSO is applied, while $\alpha=0$ yields the ridge regression.
nfolds	The number of folds for the K-fold cross validation, set to 10 by default.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
seed	If seed is TRUE the results will always be the same.
graph	If graph is TRUE (default value) a filled contour plot will appear.

#### **Details**

The K-fold cross validation is performed in order to select the optimal value for  $\lambda$ , the penalty parameter in LASSO.

#### Value

The outcome is the same as in the R package glmnet. The extra addition is that if "graph = TRUE", then the plot of the cross-validated object is returned. The contains the logarithm of  $\lambda$  and the mean squared error. The numbers on top of the figure show the number of set of coefficients for each component, that are not zero.

Cross-validation for the naive Bayes classifiers for compositional data Cross-validation for the naive Bayes classifiers for compositional data

### Description

Cross-validation for the naive Bayes classifiers for compositional data.

#### Usage

### **Arguments**

x	A matrix with the available data, the predictor variables.
ina	A vector of data. The response variable, which is categorical (factor is acceptable).
type	The type of naive Bayes, "beta", "logitnorm", "cauchy", "laplace", "gamma", "normlog" or "weibull". For the last 4 distributions, the negative of the logarithm of the compositional data is applied first.
folds	A list with the indices of the folds.
nfolds	The number of folds to be used. This is taken into consideration only if "folds" is NULL.
stratified	Do you want the folds to be selected using stratified random sampling? This preserves the analogy of the samples of each group. Make this TRUE if you wish.
seed	If you set this to TRUE, the same folds will be created every time.
pred.ret	If you want the predicted values returned set this to TRUE.

## Value

## A list including:

preds	If pred.ret is TRUE the predicted values for each fold are returned as elements

in a list.

crit A vector whose length is equal to the number of k and is the accuracy metric for

each k. For the classification case it is the percentage of correct classification.

Cross-validation for the naive Bayes classifiers for compositional data using the alpha-transformation Cross-validation for the naive Bayes classifiers for compositional data using the  $\alpha$ -transformation

# Description

Cross-validation for the naive Bayes classifiers for compositional data using the  $\alpha$ -transformation.

### Usage

```
alfanb.tune(x, ina, a = seq(-1, 1, by = 0.1), type = "gaussian", folds = NULL, nfolds = 10, stratified = TRUE, seed = FALSE)
```

### **Arguments**

x	A matrix with the available data, the predictor variables.
ina	A vector of data. The response variable, which is categorical (factor is acceptable).
а	This can be a vector of values or a single number.
type	The type of naive Bayes, "gaussian", "cauchy" or "laplace".
folds	A list with the indices of the folds.
nfolds	The number of folds to be used. This is taken into consideration only if "folds" is NULL.
stratified	Do you want the folds to be selected using stratified random sampling? This preserves the analogy of the samples of each group. Make this TRUE if you wish.
seed	If you set this to TRUE, the same folds will be created every time.

## **Details**

This function estimates the performance of the naive Bayes classifier for each value of  $\alpha$  of the  $\alpha$ -transformation.

### Value

A list including:

A vector whose length is equal to the number of k and is the accuracy metric for each k. For the classification case it is the percentage of correct classification.

Density of the Flexible Dirichlet distribution

Density of the Flexible Dirichlet distribution

# Description

Density of the Flexible Dirichlet distribution

#### Usage

```
fd.density(x, alpha, prob, tau)
```

# Arguments

x A vector or a matrix with compositional data. alpha A vector of the non-negative  $\alpha$  parameters.

prob A vector of the clusters' probabilities. It must sum to one.

tau The non-negative scalar tau parameter.

## **Details**

For more information see the references.

### Value

The density value(s).

### Author(s)

Michail Tsagris ported from the R package FlexDir. <mtsagris@uoc.gr>.

alpha <- c(12, 11, 10)
prob <- c(0.25, 0.25, 0.5)
tau <- 8
x <- rfd(20, alpha, prob, tau)
fd.density(x, alpha, prob, tau)</pre>
```

Density values of a Dirichlet distribution

Density values of a Dirichlet distribution

## **Description**

Density values of a Dirichlet distribution.

### Usage

```
ddiri(x, a, logged = TRUE)
```

## **Arguments**

Х	A matrix containing compositional data. This can be a vector or a matrix with the data.
а	A vector of parameters. Its length must be equal to the number of components, or columns of the matrix with the compositional data and all values must be greater than zero.
logged	A boolean variable specifying whether the logarithm of the density values to be returned. It is set to TRUE by default.

#### **Details**

The density of the Dirichlet distribution for a vector or a matrix of compositional data is returned.

## Value

A vector with the density values.

a</pre>
```

Dirichlet discriminant analysis

Dirichlet discriminant analysis

## **Description**

Dirichlet discriminant analysis.

### Usage

```
dda(xnew, x, ina)
```

# Arguments

xnew	A matrix with the new compositional predictor data whose class you want to predict. Zeros are allowed.
X	A matrix with the available compositional predictor data. Zeros are allowed.
ina	A vector of data. The response variable, which is categorical (factor is acceptable).

## **Details**

The funcitons performs maximum likelihood discriminant analysis using the Dirichlet distribution.

## Value

A vector with the estimated group.

Dirichlet random values simulation

Dirichlet random values simulation

## **Description**

Dirichlet random values simulation.

### Usage

```
rdiri(n, a)
```

## **Arguments**

- n The sample size, a numerical value.
- a A numerical vector with the parameter values.

#### **Details**

The algorithm is straightforward, for each vector, independent gamma values are generated and then divided by their total sum.

50 Dirichlet regression

### Value

A matrix with the simulated data.

## Author(s)

Michail Tsagris.

```

Dirichlet regression Dirichlet regression

# Description

Dirichlet regression.

## Usage

```
diri.reg(y, x, plot = TRUE, xnew = NULL)
diri.reg2(y, x, xnew = NULL)
```

### **Arguments**

У	A matrix with the compositional data (dependent variable). Zero values are not allowed.
x	The predictor variable(s), they can be either continuous or categorical or both.
plot	A boolean variable specifying whether to plot the leverage values of the observations or not. This is taken into account only when xnew = NULL.
xnew	If you have new data use it, otherwise leave it NULL.

Dirichlet regression 51

#### **Details**

A Dirichlet distribution is assumed for the regression. This involves numerical optimization. The function "diri.reg2" allows for the covariates to be linked with the precision parameter  $\phi$  via the exponential link function  $\phi = e^{x*b}$ .

### Value

#### A list including:

runtime The time required by the regression. The value of the log-likelihood. loglik The precision parameter. If covariates are linked with it (function "diri.reg2"), phi this will be a vector. The coefficients of the phi parameter if it is linked to the covariates. phipar The standard errors of the coefficients of the phi parameter is it linked to the std.phi covariates. log.phi The logarithm of the precision parameter. std.logphi The standard error of the logarithm of the precision parameter. be The beta coefficients. seb The standard error of the beta coefficients.

sigma Th covariance matrix of the regression parameters (for the mean vector and the

phi parameter) in the function "diri.reg2".

lev The leverage values.

est For the "diri.reg" this contains the fitted or the predicted values (if xnew is not

NULL). For the "diri.reg2" if xnew is NULL, this is also NULL.

### Author(s)

mod2 <-diri.reg2(y, x)
mod3 <- comp.reg(y, x)</pre>
```

Distance based regression models for proportions

Distance based regression models for proportions

## **Description**

Distance based regression models for proportions.

### Usage

```
ols.prop.reg(y, x, cov = FALSE, tol = 1e-07, maxiters = 100) helling.prop.reg(y, x, tol = 1e-07, maxiters = 100)
```

## **Arguments**

У	A numerical vector proportions. 0s and 1s are allowed.
x	A matrix or a data frame with the predictor variables.
cov	Should the covariance matrix be returned? TRUE or FALSE.
tol	The tolerance value to terminate the Newton-Raphson algorithm. This is set to $10^{-9}$ by default.
maxiters	The maximum number of iterations before the Newton-Raphson is terminated automatically.

## **Details**

We are using the Newton-Raphson, but unlike R's built-in function "glm" we do no checks and no extra calculations, or whatever. Simply the model. The functions accept binary responses as well (0 or 1).

### Value

A list including:

sse	The sum of	of saures o	f errors fo	or the "	ols.prop.reg"	function.

be The estimated regression coefficients.

seb The standard error of the regression coefficients if "cov" is TRUE.

covb The covariance matrix of the regression coefficients in "ols.prop.reg" if "cov" is

TRUE.

H The Hellinger distance between the true and the observed proportions in "helling.prop.reg".

iters The number of iterations required by the Newton-Raphson.

### Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

propreg, beta.reg
```

## **Examples**

```
y <- rbeta(100, 1, 4)
x <- matrix(rnorm(100 * 2), ncol = 2)
a1 <- ols.prop.reg(y, x)
a2 <- helling.prop.reg(y, x)</pre>
```

Divergence based regression for compositional data  $% \left( 1\right) =\left( 1\right) \left( 1\right) \left($ 

Divergence based regression for compositional data

## **Description**

Regression for compositional data based on the Kullback-Leibler the Jensen-Shannon divergence and the symmetric Kullback-Leibler divergence.

### Usage

```
kl.compreg(y, x, B = 1, ncores = 1, xnew = NULL, tol = 1e-07, maxiters = 50) js.compreg(y, x, B = 1, ncores = 1, xnew = NULL) tv.compreg(y, x, B = 1, ncores = 1, xnew = NULL) symkl.compreg(y, x, B = 1, ncores = 1, xnew = NULL)
```

## Arguments

У	A matrix with the compositional data (dependent variable). Zero values are allowed.
x	The predictor variable(s), they can be either continuous or categorical or both.
В	If B is greater than 1 bootstrap estimates of the standard error are returned. If B=1, no standard errors are returned.
ncores	If ncores is 2 or more parallel computing is performed. This is to be used for the case of bootstrap. If B=1, this is not taken into consideration.
xnew	If you have new data use it, otherwise leave it NULL.
tol	The tolerance value to terminate the Newton-Raphson procedure.
maxiters	The maximum number of Newton-Raphson iterations.

#### **Details**

In the kl.compreg the Kullback-Leibler divergence is adopted as the objective function. In case of problematic convergence the "multinom" function by the "nnet" package is employed. This will obviously be slower. The js.compreg uses the Jensen-Shannon divergence and the symkl.compreg uses the symmetric Kullback-Leibler divergence. The tv.compreg uses the Total Variation divergence. There is no actual log-likelihood for neither regression.

#### Value

## A list including:

runtime	The time required by the regression.
iters	The number of iterations required by the Newton-Raphson in the kl.compreg function.
loglik	The log-likelihood. This is actually a quasi multinomial regression. This is bascially minus the half deviance, or $-\sum_{i=1}^n y_i \log y_i/\hat{y}_i$ .
be	The beta coefficients.
covbe	The covariance matrix of the beta coefficients, if bootstrap is chosen, i.e. if $B > 1$ .
est	The fitted values of xnew if xnew is not NULL.

Divergence based regression for compositional data with compositional data in the covariates side using the  $\alpha$ -transformation

## Description

Divergence based regression for compositional data with compositional data in the covariates side using the  $\alpha$ -transformation.

### Usage

```
kl.alfapcr(y, x, covar = NULL, a, k, xnew = NULL, B = 1, ncores = 1, tol = 1e-07, maxiters = 50)
```

# **Arguments**

y A numerical matrixe with	compositional data with or without zeros.
----------------------------	---

x A matrix with the predictor variables, the compositional data. Zero values are allowed.

covar If you have other covariates as well put themn here.

a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
k	A number at least equal to 1. How many principal components to use.
xnew	A matrix containing the new compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.
В	If B is greater than 1 bootstrap estimates of the standard error are returned. If $B=1$ , no standard errors are returned.
ncores	If ncores is 2 or more parallel computing is performed. This is to be used for the case of bootstrap. If B=1, this is not taken into consideration.
tol	The tolerance value to terminate the Newton-Raphson procedure.
maxiters	The maximum number of Newton-Raphson iterations.

#### **Details**

The  $\alpha$ -transformation is applied to the compositional data first, the first k principal component scores are calcualted and used as predictor variables for the Kullback-Leibler divergence based regression model.

#### Value

# A list including:

runtime	The time required by the regression.
iters	The number of iterations required by the Newton-Raphson in the kl.compreg function.
loglik	The log-likelihood. This is actually a quasi multinomial regression. This is bascially minus the half deviance, or $-sum_{i=1}^n y_i \log y_i/\hat{y}_i$ .
be	The beta coefficients.
seb	The standard error of the beta coefficients, if bootstrap is chosen, i.e. if $B > 1$ .
est	The fitted values of xnew if xnew is not NULL.

Divergence matrix of compositional data

Divergence matrix of compositional data

## **Description**

Divergence matrix of compositional data.

### Usage

```
divergence(x, type = "kullback_leibler", vector = FALSE)
```

### **Arguments**

x A matrix with the compositional data.

type This is either "kullback\_leibler" (Kullback-Leibler, which computes the sym-

metric Kullback-Leibler divergence) or "jensen\_shannon" (Jensen-Shannon) di-

vergence.

vector For return a vector instead a matrix.

#### **Details**

The function produces the distance matrix either using the Kullback-Leibler (distance) or the Jensen-Shannon (metric) divergence. The Kullback-Leibler refers to the symmetric Kullback-Leibler divergence.

#### Value

if the vector argument is FALSE a symmetric matrix with the divergences, otherwise a vector with the divergences.

Empirical likelihood for a one sample mean vector hypothesis testing

\*Empirical likelihood for a one sample mean vector hypothesis testing\*

## **Description**

Empirical likelihood for a one sample mean vector hypothesis testing.

## Usage

```
el.test1(x, mu, R = 1, ncores = 1, graph = FALSE)
```

## **Arguments**

X	A matrix containing Euclidean data.
mu	The hypothesized mean vector.
R	If R is 1 no bootstrap calibration is performed and the classical p-value via the $\chi^2$ distribution is returned. If R is greater than 1, the bootstrap p-value is returned.
ncores	The number of cores to use, set to 1 by default.
graph	A boolean variable which is taken into consideration only when bootstrap calibration is performed. IF TRUE the histogram of the bootstrap test statistic values is plotted.

#### **Details**

Multivariate hypothesis test for a one sample mean vector. This is a non parametric test and it works for univariate and multivariate data.

#### Value

A list with the outcome of the function el.test which includes the -2 log-likelihood ratio, the observed P-value by chi-square approximation, the final value of Lagrange multiplier  $\lambda$ , the gradient at the maximum, the Hessian matrix, the weights on the observations (probabilities multiplied by the sample size) and the number of iteration performed. In addition the runtime of the procedure is reported. In the case of bootstrap, the bootstrap p-value is also returned.

```

Empirical likelihood hypothesis testing for two mean vectors

Empirical likelihood hypothesis testing for two mean vectors

### **Description**

Empirical likelihood hypothesis testing for two mean vectors.

### Usage

```
el.test2(y1, y2, R = 0, ncores = 1, graph = FALSE)
```

#### **Arguments**

y1 A matrix containing the Euclidean data of the first group.
 y2 A matrix containing the Euclidean data of the second group.

R If R is 0, the classical chi-square distribution is used, if R = 1, the corrected chi-

square distribution (James, 1954) is used and if R = 2, the modified F distribution (Krishnamoorthy and Yanping, 2006) is used. If R is greater than 3 bootstrap

calibration is performed.

ncores How many to cores to use.

graph A boolean variable which is taken into consideration only when bootstrap cali-

bration is performed. IF TRUE the histogram of the bootstrap test statistic values

is plotted.

#### **Details**

Empirical likelihood is a non parametric hypothesis testing procedure for one sample. The generalization to two (or more samples) is via searching for the mean vector that minimizes the sum of the two test statistics.

### Value

### A list including:

test The empirical likelihood test statistic value.

modif.test The modified test statistic, either via the chi-square or the F distribution.

dof Thre degrees of freedom of the chi-square or the F distribution.

pvalue The asymptotic or the bootstrap p-value.

mu The estimated common mean vector.

runtime The runtime of the bootstrap calibration.

Estimating location and scatter parameters for compositional data

\*Estimating location and scatter parameters for compositional data\*

## **Description**

Estimating location and scatter parameters for compositional data in a robust and non robust way.

### Usage

```
comp.den(x, type = "alr", dist = "normal", tol = 1e-07)
```

### **Arguments**

Χ	A matrix containing compositional data. No zero values are allowed.
type	A boolean variable indicating the transformation to be used. Either "alr" or "ilr" corresponding to the additive or the isometric log-ratio transformation respectively.
dist	Takes values "normal", "t", "skewnorm", "rob" and "spatial". They first three options correspond to the parameters of the normal, t and skew normal distribution respectively. If it set to "rob" the MCD estimates are computed and if set to "spatial" the spatial median and spatial sign covariance matrix are computed.
tol	A tolerance level to terminate the process of finding the spatial median when dist = "spatial". This is set to 1e-09 by default.

#### **Details**

This function calculates robust and non robust estimates of location and scatter.

### Value

A list including: The mean vector and covariance matrix mainly. Other parameters are also returned depending on the value of the argument "dist".

Estimation of the probability left outside the simplex when using the alpha-transformation

Estimation of the probability left outside the simplex when using the alpha-transformation

## **Description**

Estimation of the probability left outside the simplex when using the alpha-transformationn.

#### Usage

```
probout(mu, su, a)
```

#### **Arguments**

mu The mean vector. su The covariance matrix. a The value of  $\alpha$ .

#### **Details**

When applying the  $\alpha$ -transformation based on a multivariate normal there might be probability left outside the simplex as the space of this transformation is a subspace of the Euclidean space. The function estimates the missing probability via Monte Carlo simulation using 40 million generated vectors.

## Value

The estimated probability left outside the simplex.

Estimation of the value of alpha in the folded model Estimation of the value of  $\alpha$  in the folded model

## Description

Estimation of the value of  $\alpha$  in the folded model.

### Usage

```
a.est(x)
```

#### **Arguments**

X

A matrix with the compositional data. No zero vaues are allowed.

### **Details**

This is a function for choosing or estimating the value of  $\alpha$  in the folded model (Tsagris and Stewart, 2020).

#### Value

A list including:

runtime The runtime of the algorithm.

best The estimated optimal  $\alpha$  of the folded model.

loglik The maximimised log-likelihood of the folded model.

p The estimated probability inside the simplex of the folded model.

mu The estimated mean vector of the folded model.

su The estimated covariance matrix of the folded model.

Exponential empirical likelihood for a one sample mean vector hypothesis testing

Exponential empirical likelihood for a one sample mean vector hypothesis testing

## **Description**

Exponential empirical likelihood for a one sample mean vector hypothesis testing.

#### Usage

```
eel.test1(x, mu, tol = 1e-06, R = 1)
```

### **Arguments**

X	A matrix containing Euclidean data.
mu	The hypothesized mean vector.
tol	The tolerance value used to stop the Newton-Raphson algorithm.
R	The number of bootstrap samples used to calculate the p-value. If $R = 1$ (default value), no bootstrap calibration is performed

#### **Details**

Multivariate hypothesis test for a one sample mean vector. This is a non parametric test and it works for univariate and multivariate data.

### Value

A list including:

p The estimated probabilities.

1ambda The value of the Lagrangian parameter  $\lambda$ .

iter The number of iterations required by the newton-Raphson algorithm.

info The value of the log-likelihood ratio test statistic along with its corresponding

p-value.

runtime The runtime of the process.

Fast estimation of the value of alpha  ${\it Fast \ estimation \ of \ the \ value \ of \ } \alpha$ 

### Description

Fast estimation of the value of  $\alpha$ .

## Usage

```
alfa.tune(x, B = 1, ncores = 1)
```

## **Arguments**

x A matrix with the compositional data. No zero vaues are allowed.

B If no (bootstrap based) confidence intervals should be returned this should be 1

and more than 1 otherwise.

ncores If ncores is greater than 1 parallel computing is performed. It is advisable to use

it if you have many observations and or many variables, otherwise it will slow

down th process.

#### **Details**

This is a faster function than alfa.profile for choosing the value of  $\alpha$ .

### Value

A vector with the best alpha, the maximised log-likelihood and the log-likelihood at  $\alpha = 0$ , when B = 1 (no bootstrap). If B>1 a list including:

param The best alpha and the value of the log-likelihod, along with the 95% bootstrap

based confidence intervals.

message A message with some information about the histogram.

runtime The time (in seconds) of the process.

Fitting a Dirichlet distribution

Fitting a Dirichlet distribution

### **Description**

Estimation of the parameters of a fitted Dirichlet distribution.

## Usage

```
diri.est(x, type = "mle")
```

### **Arguments**

x A matrix containing compositional data.

type If you want to estimate the parameters use type="mle". If you want to estimate

the mean vector along with the precision parameter, the second parametrisation

of the Dirichlet, use type="prec".

### **Details**

Maximum likelihood estimation of the parameters of a Dirichlet distribution is performed.

#### Value

A list including:

loglik The value of the log-likelihood.

param The estimated parameters.

phi The estimated precision parameter, if type = "prec".

a The estimated mean vector, if type = "prec".

runtime The run time of the maximisation procedure.

Fitting a Dirichlet distribution via Newton-Rapshon

Fitting a Dirichlet distribution via Newton-Rapshon

## **Description**

Fitting a Dirichlet distribution via Newton-Rapshon.

## Usage

```
diri.nr(x, type = 1, tol = 1e-07)
```

## **Arguments**

x A matrix containing compositional data. Zeros are not allowed.

type Type can either be 1, so that the Newton-Rapshon is used for the maximisation

of the log-likelihood, as Minka (2012) suggested or it can be 1. In the latter case the Newton-Raphson algorithm is implemented involving matrix inversions. In addition an even faster implementation has been implemented (in C++) in the

package Rfast and is used here.

tol The tolerance level indicating no further increase in the log-likelihood.

#### **Details**

Maximum likelihood estimation of the parameters of a Dirichlet distribution is performed via Newton-Raphson. Initial values suggested by Minka (2003) are used. The estimation is super faster than "diri.est" and the difference becomes really apparent when the sample size and or the dimensions increase. In fact this will work with millions of observations. So in general, I trust this one more than "diri.est".

The only problem I have seen with this method is that if the data are concentrated around a point, say the center of the simplex, it will be hard for this and the previous methods to give estimates of the parameters. In this extremely difficult scenario I would suggest the use of the previous function with the precision parametrization "diri.est(x, type = "prec")". It will be extremely fast and accurate.

### Value

### A list including:

iter The number of iterations required. If the argument "type" is set to 2 this is not

returned.

loglik The value of the log-likelihood.

param The estimated parameters.

runtime The run time of the procedure.

Fitting a Flexible Dirichlet distribution
Fitting a Flexible Dirichlet distribution

# Description

Fitting a Flexible Dirichlet distribution.

### Usage

```
fd.est(x, ini.iter = 50, final.iter = 100)
```

### **Arguments**

A matrix or a dataframe containing the compositional data.
 ini.iter
 Number of iterations for the initial SEM step. Default value is 50.
 final.iter
 Number of iterations for the final EM step. Default value is 100.

#### **Details**

For more information see the references.

A list including:

alpha Estimated values of the parameter vector  $\alpha$ . Estimated values of the parameter vector p. tau Estimated value of the parameter tau.

loglik The Log-likelihood value.

Gaussian mixture models for compositional data

Gaussian mixture models for compositional data

# Description

Gaussian mixture models for compositional data.

```
mix.compnorm(x, g, model, type = "alr", veo = FALSE)
```

x A matrix with the compositional data.

g How many clusters to create.

model The type of model to be used.

- 1. "EII": All groups have the same diagonal covariance matrix, with the same variance for all variables.
- 2. "VII": Different diagonal covariance matrices, with the same variance for all variables within each group.
- 3. "EEI": All groups have the same diagonal covariance matrix.
- 4. "VEI": Different diagonal covariance matrices. If we make all covariance matrices have determinant 1, (divide the matrix with the \$p\$-th root of its determinant) then all covariance matrices will be the same.
- 5. "EVI": Different diagonal covariance matrices with the same determinant.
- 6. "VVI": Different diagonal covariance matrices, with nothing in common.
- 7. "EEE": All covariance matrices are the same.
- 8. "EEV": Different covariance matrices, but with the same determinant and in addition, if we make them have determinant 1, they will have the same trace.
- 9. "VEV": Different covariance matrices but if we make the matrices have determinant 1, then they will have the same trace.
- 10. "VVV": Different covariance matrices with nothing in common.
- 11. "EVE": Different covariance matrices, but with the same determinant. In addition, calculate the eigenvectors for each covariance matrix and you will see the extra similarities.
- 12. "VVE": Different covariance matrices, but they have something in common with their directions. Calculate the eigenvectors of each covariance matrix and you will see the similarities.
- 13. "VEE": Different covariance matrices, but if we make the matrices have determinant 1, then they will have the same trace. In addition, calculate the eigenvectors for each covariance matrix and you will see the extra similarities.
- 14. "EVV": Different covariance matrices, but with the same determinant.

type

The type of trasformation to be used, either the additive log-ratio ("alr"), the isometric log-ratio ("ilr") or the pivot coordinate ("pivot") transformation.

veo

Stands for "Variables exceed observations". If TRUE then if the number variablesin the model exceeds the number of observations, but the model is still fitted.

#### **Details**

A log-ratio transformation is applied and then a Gaussian mixture model is constructed.

### Value

A list including:

76	Gaussian mixture models for compositional data using the alpha-transformation	
mu	A matrix where each row corresponds to the mean vector of each cluster.	
su	An array containing the covariance matrix of each cluster.	
prob	The estimated mixing probabilities.	
est	The estimated cluster membership values.

Generate random folds for cross-validation

Generate random folds for cross-validation

## **Description**

Random folds for use in a cross validation are generated. There is the option for stratified splitting as well.

### Usage

```
makefolds(ina, nfolds = 10, stratified = TRUE, seed = FALSE)
```

### **Arguments**

ina A variable indicating the groupings.nfolds The number of folds to produce.

stratified A boolean variable specifying whether stratified random (TRUE) or simple ran-

dom (FALSE) sampling is to be used when producing the folds.

seed A boolean variable. If set to TRUE, the folds will always be the same.

#### **Details**

I was inspired by the command in the package **TunePareto** in order to do the stratified version.

#### Value

A list with nfolds elements where each elements is a fold containing the indices of the data.

```

Helper Frechet mean for compositional data Helper Frechet mean for compositional data

## **Description**

Helper Frechet mean for compositional data.

```
frechet2(x, di, a, k)
```

X	A matrix with the compositional data.
di	A matrix with indices as produced by the function "dista" of the package "Rfast"" or the function "nn2" of the package "RANN". Better see the details section.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied and the closed geometric mean is calculated.
k	The number of nearest neighbours used for the computation of the Frechet means.

#### **Details**

The power transformation is applied to the compositional data and the mean vector is calculated. Then the inverse of it is calculated and the inverse of the power transformation applied to the last vector is the Frechet mean.

What this helper function do is to speed up the Frechet mean when used in the  $\alpha$ -k-NN regression. The  $\alpha$ -k-NN regression computes the Frechet mean of the k nearest neighbours for a value of  $\alpha$  and this function does exactly that. Suppose you want to predict the compositional value of some new predictors. For each predictor value you must use the Frechet mean computed at various nearest neighbours. This function performs these computations in a fast way. It is not the fastest way, yet it is a pretty fast way. This function is being called inside the function aknn.reg.

### Value

A list where eqch element contains a matrix. Each matrix contains the Frechet means computed at various nearest neighbours.

### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

## End(Not run)</pre>
```

Helper functions for the Kullback-Leibler regression  $Helper\ functions\ for\ the\ Kullback-Leibler\ regression$ 

# Description

Helper functions for the Kullback-Leibler regression.

## Usage

```
kl.compreg2(y, x, xnew = NULL, tol = 1e-07, maxiters = 50)
klcompreg.boot(y, x, der, der2, id, b1, n, p, d, tol = 1e-07, maxiters = 50)
```

### **Arguments**

у	A matrix with the compositional data (dependent variable). Zero values are allowed. For the klcompreg.boot the first column is removed.
X	The predictor variable(s), they can be either continuous or categorical or both. In the klcompreg.boot this is the design matrix, with the ones in the first column.
xnew	If you have new data use it, otherwise leave it NULL.
tol	The tolerance value to terminate the Newton-Raphson procedure.
maxiters	The maximum number of Newton-Raphson iterations.
der	An vector to put the first derivative there.
der2	An empty matrix to put the second derivatives there, the Hessian matrix will be put here.
id	A help vector with indices.
b1	The matrix with the initial estimated coefficients.
n	The sample size
р	The number of columns of the design matrix.
d	The dimensionality of the simplex, that is the number of columns of the compositional data minus 1.

#### **Details**

These are help functions for the kl.compreg function. They are not to be called directly by the user.

For kl.compreg2 a list including:

iters The nubmer of iterations required by the Newton-Raphson.

loglik The loglikelihood. be The beta coefficients.

est The fitted or the predicted values (if xnew is not NULL).

For klcompreg.boot a list including:

loglik The loglikelihood.
be The beta coefficients.

Hotelling's multivariate version of the 1 sample t-test for Euclidean data

Hotelling's multivariate version of the 1 sample t-test for Euclidean data

## **Description**

Hotelling's test for testing one Euclidean population mean vector.

```
hotel1T2(x, M, a = 0.05, R = 999, graph = FALSE)
```

Х	A matrix containing Euclidean data.
a	The significance level, set to 0.05 by default.
М	The hypothesized mean vector.
R	If R is 1 no bootstrap calibration is performed and the classical p-value via the F distribution is returned. If R is greater than 1, the bootstrap p-value is returned.
graph	A boolean variable which is taken into consideration only when bootstrap calibration is performed. IF TRUE the histogram of the bootstrap test statistic values is plotted.

#### **Details**

Multivariate hypothesis test for a one sample mean vector. This is the multivariate analogue of the one sample t-test. The p-value can be calculated either asymptotically or via bootstrap.

#### Value

A list including:

m The sample mean vector.

info The test statistic, the p-value, the critical value and the degrees of freedom of

the F distribution (numerator and denominator). This is given if no bootstrap

calibration is employed.

pvalue The bootstrap p-value is bootstrap is employed.

runtime The runtime of the bootstrap calibration.

```

Hotelling's multivariate version of the 2 sample t-test for Euclidean data

Hotelling's multivariate version of the 2 sample t-test for Euclidean data

## **Description**

Hotelling's test for testing the equality of two Euclidean population mean vectors.

## Usage

```
hotel2T2(x1, x2, a = 0.05, R = 999, graph = FALSE)
```

## **Arguments**

x1	A matrix containing the Euclidean data of the first group.
x2	A matrix containing the Euclidean data of the second group.
a	The significance level, set to 0.05 by default.
R	If R is 1 no bootstrap calibration is performed and the classical p-value via the F distribution is returned. If R is greater than 1, the bootstrap p-value is returned.
graph	A boolean variable which is taken into consideration only when bootstrap calibration is performed. IF TRUE the histogram of the bootstrap test statistic values is plotted.

### **Details**

Multivariate analysis of variance assuming equality of the covariance matrices. The p-value can be calculated either asymptotically or via bootstrap.

## Value

## A list including:

mesoi	The two mean vectors.
info	The test statistic, the p-value, the critical value and the degrees of freedom of the F distribution (numerator and denominator). This is given if no bootstrap calibration is employed.
pvalue	The bootstrap p-value is bootstrap is employed.
note	A message informing the user that bootstrap calibration has been employed.
runtime	The runtime of the bootstrap calibration.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

### References

Everitt B. (2005). An R and S-Plus Companion to Multivariate Analysis p. 139-140. Springer.

#### See Also

```
james,maov,el.test2,comp.test
```

### **Examples**

Hypothesis testing for two or more compositional mean vectors

Hypothesis testing for two or more compositional mean vectors

# Description

Hypothesis testing for two or more compositional mean vectors.

## Usage

```
comp.test(x, ina, test = "james", R = 0, ncores = 1, graph = FALSE)
```

### Arguments

Х	A matrix containing compositional data.
ina	A numerical or factor variable indicating the groups of the data.
test	This can take the values of "james" for James' test, "hotel" for Hotelling's test, "maov" for multivariate analysis of variance assuming equality of the covariance matrices, "maovjames" for multivariate analysis of variance without assuming equality of the covariance matrices. "el" for empirical likelihood or "eel" for exponential empirical likelihood.
R	This depends upon the value of the argument "test". If the test is "maov" or "maovjames", R is not taken into consideration. If test is "hotel", then R denotes the number of bootstrap resamples. If test is "james", then R can be 1 (chi-square distribution), 2 (F distribution), or more for bootstrap calibration. If test is "el", then R can be 0 (chi-square), 1 (corrected chi-square), 2 (F distribution) or more for bootstrap calibration. See the help page of each test for more information.
ncores	How many to cores to use. This is taken into consideration only if test is "el" and R is more than 2.
graph	A boolean variable which is taken into consideration only when bootstrap calibration is performed. IF TRUE the histogram of the bootstrap test statistic values

is plotted. This is taken into account only when R is greater than 2.

#### **Details**

The idea is to apply the  $\alpha$ -transformation, with  $\alpha=1$ , to the compositional data and then use a test to compare their mean vectors. See the help page of each test for more information. The function is visible so you can see exactly what is going on.

#### Value

A list including:

result

The outcome of each test.

Inverse of the alpha-transformation  ${\it Inverse~of~the~\alpha-transformation}$ 

## **Description**

The inverse of the  $\alpha$ -transformation.

### Usage

```
alfainv(x, a, h = TRUE)
```

#### **Arguments**

X	A matrix with Euclidean data. However, they must lie within the feasible, acceptable space. See references for more information.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ , the inverse of the isometric log-ratio transformation is applied.
h	If h = TRUE this means that the multiplication with the Helmer sub-matrix will take place. It is set to TRUe by default.

### **Details**

The inverse of the  $\alpha$ -transformation is applied to the data. If the data lie outside the  $\alpha$ -space, NAs will be returned for some values.

# Value

A matrix with the pairwise distances.

# Author(s)

Michail Tsagris.

James multivariate version of the t-test  ${\it James \; multivariate \; version \; of \; the \; t\text{-}test}$ 

# Description

James test for testing the equality of two population mean vectors without assuming equality of the covariance matrices.

### Usage

```
james(y1, y2, a = 0.05, R = 999, graph = FALSE)
```

## **Arguments**

y1	A matrix containing the Euclidean data of the first group.
y2	A matrix containing the Euclidean data of the second group.
а	The significance level, set to 0.05 by default.
R	If R is 1 no bootstrap calibration is performed and the classical p-value via the F distribution is returned. If R is greater than 1, the bootstrap p-value is returned.
graph	A boolean variable which is taken into consideration only when bootstrap calibration is performed. IF TRUE the histogram of the bootstrap test statistic values is plotted.

# **Details**

Multivariate analysis of variance without assuming equality of the covariance matrices. The p-value can be calculated either asymptotically or via bootstrap. The James test (1954) or a modification proposed by Krishnamoorthy and Yanping (2006) is implemented. The James test uses a corrected chi-square distribution, whereas the modified version uses an F distribution.

### A list including:

note A message informing the user about the test used.

mesoi The two mean vectors.

info The test statistic, the p-value, the correction factor and the corrected critical

value of the chi-square distribution if the James test has been used or, the test statistic, the p-value, the critical value and the degrees of freedom (numerator and denominator) of the F distribution if the modified James test has been used.

pvalue The bootstrap p-value if bootstrap is employed.

runtime The runtime of the bootstrap calibration.

Kullback-Leibler divergence and Bhattacharyya distance between two Dirichlet distributions

Kullback-Leibler divergence and Bhattacharyya distance between two

Dirichlet distributions

## Description

Kullback-Leibler divergence and Bhattacharyya distance between two Dirichlet distributions.

### Usage

```
kl.diri(a, b, type = "KL")
```

#### **Arguments**

a A vector with	the parameters of the	first Dirichlet distribution.
-----------------	-----------------------	-------------------------------

b A vector with the parameters of the second Dirichlet distribution.

type A variable indicating whether the Kullback-Leibler divergence ("KL") or the

Bhattacharyya distance ("bhatt") is to be computed.

### **Details**

Note that the order is important in the Kullback-Leibler divergence, since this is asymmetric, but not in the Bhattacharyya distance, since it is a metric.

#### Value

The value of the Kullback-Leibler divergence or the Bhattacharyya distance.

LASSO Kullback-Leibler divergence based regression

LASSO Kullback-Leibler divergence based regression

### **Description**

LASSO Kullback-Leibler divergence based regression.

#### Usage

```
lasso.klcompreg(y, x, alpha = 1, lambda = NULL,
nlambda = 100, type = "grouped", xnew = NULL)
```

### **Arguments**

y A numerical matrix with compositional data. Zero values are allowed.

x A numerical matrix containing the predictor variables.

alpha The elastic net mixing parameter, with  $0 \le \alpha \le 1$ . The penalty is defined as

a weighted combination of the ridge and of the Lasso regression. When  $\alpha=1$ 

LASSO is applied, while  $\alpha = 0$  yields the ridge regression.

lambda This information is copied from the package glmnet. A user supplied lambda

sequence. Typical usage is to have the program compute its own lambda sequence based on nlambda and lambda.min.ratio. Supplying a value of lambda overrides this. WARNING: use with care. Avoid supplying a single value for lambda (for predictions after CV use predict() instead). Supply instead a decreasing sequence of lambda values. glmnet relies on its warms starts for speed,

and its often faster to fit a whole path than compute a single fit.

nlambda This information is copied from the package glmnet. The number of lambda

values, default is 100.

type This information is copied from the package glmnet.. If "grouped" then a

grouped lasso penalty is used on the multinomial coefficients for a variable. This ensures they are all in our out together. The default in our case is "grouped".

xnew If you have new data use it, otherwise leave it NULL.

#### **Details**

The function uses the glmnet package to perform LASSO penalised regression. For more details see the function in that package.

#### Value

A list including:

mod We decided to keep the same list that is returned by glmnet. So, see the function

in that package for more information.

est

If you supply a matrix in the "xnew" argument this will return an array of many matrices with the fitted values, where each matrix corresponds to each value of  $\lambda$ .

```

LASSO log-ratio regression with compositional response  $L\!ASSO\;log\text{-}ratio\;regression\;with\;compositional\;response}$ 

## **Description**

LASSO log-ratio regression with compositional response.

## Usage

```
lasso.compreg(y, x, alpha = 1, lambda = NULL,
nlambda = 100, xnew = NULL)
```

## **Arguments**

y A numerical matrix with compositional data. Zero values are not allowed as the additive log-ratio transformation (alr) is applied to the compositional response prior to implementing the LASSO algorithm.

x A numerical matrix containing the predictor variables.

a weighted combination of the ridge and of the Lasso regression. When  $\alpha=1\,$ 

LASSO is applied, while  $\alpha = 0$  yields the ridge regression.

1 This information is copied from the package glmnet. A user supplied lambda

```

Log-contrast regression with compositional predictor variables

\*Log-contrast regression with compositional predictor variables\*

### Description

Log-contrast regression with compositional predictor variables.

## Usage

```
lc.reg(y, x, z, xnew = NULL, znew = NULL)
```

# Arguments

у	A numerical vector containing the response variable values. This must be a continuous variable.
X	A matrix with the predictor variables, the compositional data. No zero values are allowed.
Z	A matrix, data.frame, factor or a vector with some other covariate(s).
xnew	A matrix containing the new compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.
znew	A matrix, data.frame, factor or a vector with the values of some other covariate(s). If you have no new data, leave this NULL as is by default.

### **Details**

The function performs the log-contrast regression model as described in Aitchison (2003), pg. 84-85. The logarithm of the compositional predictor variables is used (hence no zero values are allowed). The response variable is linked to the log-transformed data with the constraint that the sum of the regression coefficients equals 0. Hence, we apply constrained least squares, which has a closed form solution. The constrained least squares is described in Chapter 8.2 of Hansen (2019). The idea is to minimise the sum of squares of the residuals under the constraint  $R^T\beta = c$ , where c = 0 in our case. If you want the regression without the zum-to-zero contraints see ulc.reg. Extra predictors variables are allowed as well, for instance categorical or continuous.

A list including:

be The constrained regression coefficients. Their sum equals 0. covbe If covariance matrix of the constrained regression coefficients.

va The estimated regression variance.

residuals The vector of residuals.

est If the arguments "xnew" and znew were given these are the predicted or esti-

mated values, otherwise it is NULL.

### Author(s)

x <- x / rowSums(x)
mod1 <- lc.reg(y, x)
mod2 <- lc.reg(y, x, z = iris[, 5])</pre>
```

 $Log-contrast\ regression\ with\ multiple\ compositional\ predictors$   $Log-contrast\ regression\ with\ multiple\ compositional\ predictors$ 

# Description

Log-contrast regression with multiple compositional predictors.

```
lc.reg2(y, x, z, xnew = NULL, znew = NULL)
```

У	A numerical vector containing the response variable values. This must be a continuous variable.
X	A list with multiple matrices with the predictor variables, the compositional data. No zero values are allowed.
Z	A matrix, data.frame, factor or a vector with some other covariate(s).
xnew	A matrix containing a list with multiple matrices with compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.
znew	A matrix, data.frame, factor or a vector with the values of some other covariate(s). If you have no new data, leave this NULL as is by default.

#### **Details**

The function performs the log-contrast regression model as described in Aitchison (2003), pg. 84-85. The logarithm of the compositional predictor variables is used (hence no zero values are allowed). The response variable is linked to the log-transformed data with the constraint that the sum of the regression coefficients equals 0. Hence, we apply constrained least squares, which has a closed form solution. The constrained least squares is described in Chapter 8.2 of Hansen (2019). The idea is to minimise the sum of squares of the residuals under the constraint  $R^T\beta = c$ , where c = 0 in our case. If you want the regression without the zum-to-zero contraints see ulc.reg2. Extra predictors variables are allowed as well, for instance categorical or continuous. The difference with lc.reg is that instead of one, there are multiple compositions treated as predictor variables.

#### Value

A list including:

be The constrained regression coefficients. Their sum equals 0. covbe If covariance matrix of the constrained regression coefficients.

va The estimated regression variance.

residuals The vector of residuals.

est If the arguments "xnew" and "znew" were given these are the predicted or esti-

mated values, otherwise it is NULL.

Log-likelihood ratio test for a Dirichlet mean vector

Log-likelihood ratio test for a Dirichlet mean vector

### Description

Log-likelihood ratio test for a Dirichlet mean vector.

#### **Usage**

```
dirimean.test(x, a)
```

### **Arguments**

- x A matrix with the compositional data. No zero values are allowed.
- A compositional mean vector. The concentration parameter is estimated at first. If the elements do not sum to 1, it is assumed that the Dirichlet parameters are supplied.

### **Details**

Log-likelihood ratio test is performed for the hypothesis the given vector of parameters "a" describes the compositional data well.

If there are no zeros in the data, a list including:

param A matrix with the estimated parameters under the null and the alternative hy-

pothesis.

loglik The log-likelihood under the alternative and the null hypothesis.

info The value of the test statistic and its relevant p-value.

dirimean.test(x, c(1, 2, 3)/6)
```

Log-likelihood ratio test for a symmetric Dirichlet distribution

Log-likelihood ratio test for a symmetric Dirichlet distribution

### **Description**

Log-likelihood ratio test for a symmetric Dirichlet distribution.

## Usage

```
sym.test(x)
```

### **Arguments**

x A matrix with the compositional data. No zero values are allowed.

### Details

Log-likelihood ratio test is performed for the hypothesis that all Dirichelt parameters are equal.

A list including:

est.par The estimated parameters under the alternative hypothesis.

one.par The value of the estimated parameter under the null hypothesis.

res The loglikelihood under the alternative and the null hypothesis, the value of the

test statistic, its relevant p-value and the associated degrees of freedom, which are actually the dimensionality of the simplex, D-1, where D is the number of

components.

```

Mixture model selection via BIC

Mixture model selection via BIC

## **Description**

Mixture model selection via BIC.

```
bic.mixcompnorm(x, G, type = "alr", veo = FALSE, graph = TRUE)
```

x	A matrix with compositional data.
G	A numeric vector with the number of components, clusters, to be considered.
type	The type of trasformation to be used, either the additive log-ratio ("alr"), the isometric log-ratio ("ilr") or the pivot coordinate ("pivot") transformation.
veo	Stands for "Variables exceed observations". If TRUE then if the number variablesin the model exceeds the number of observations, but the model is still fitted.
graph	A boolean variable, TRUE or FALSE specifying whether a graph should be drawn or not.

### **Details**

The alr or the ilr-transformation is applied to the compositional data first and then mixtures of multivariate Gaussian distributions are fitted. BIC is used to decide on the optimal model and number of components.

#### Value

A plot with the BIC of the best model for each number of components versus the number of components. A list including:

mod A message informing the user about the best model.

BIC The BIC values for every possible model and number of components.

```

Mixture model selection with the alpha-transformation using BIC  ${\it Mixture\ model\ selection\ with\ the\ \alpha-transformation\ using\ BIC}$ 

## **Description**

Mixture model selection with the  $\alpha$ -transformation using BIC.

### Usage

```
bic.alfamixnorm(x, G, a = seq(-1, 1, by = 0.1), veo = FALSE, graph = TRUE)
```

## **Arguments**

x	A matrix with compositional data.
G	A numeric vector with the number of components, clusters, to be considered.
a	A vector with a grid of values of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
veo	Stands for "Variables exceed observations". If TRUE then if the number variablesin the model exceeds the number of observations, but the model is still fitted.
graph	A boolean variable, TRUE or FALSE specifying whether a graph should be drawn or not.

### **Details**

The  $\alpha$ -transformation is applied to the compositional data first and then mixtures of multivariate Gaussian distributions are fitted. BIC is used to decide on the optimal model and number of components.

# Value

A plot with the BIC of the best model for each number of components versus the number of components and a list with the results of the Gaussian mixture model for each value of  $\alpha$ .

 $\ensuremath{\mathsf{MLE}}$  for the multivariate t distribution

MLE for the multivariate t distribution

# **Description**

MLE of the parameters of a multivariate t distribution.

# Usage

```
multivt(y, plot = FALSE)
```

## Arguments

y A matrix with continuous data.

plot If plot is TRUE the value of the maximum log-likelihood as a function of the degree of freedom is presented.

### **Details**

The parameters of a multivariate t distribution are estimated. This is used by the functions comp. den and bivt.contour.

### Value

## A list including:

center The location estimate.

scatter The scatter matrix estimate.

df The estimated degrees of freedom.

loglik The log-likelihood value.
mesos The classical mean vector.

covariance The classical covariance matrix.

MLE of distributions defined in the (0, 1) interval  $MLE \ of \ distributions \ defined \ in \ the \ (0, 1) \ interval$ 

## Description

MLE of distributions defined in the (0, 1) interval.

### Usage

```
beta.est(x, tol = 1e-07)
logitnorm.est(x)
hsecant01.est(x, tol = 1e-07)
simplex.est(x, tol = 1e-07)
kumar.est(x, tol = 1e-07)
unitweibull.est(x, tol = 1e-07, maxiters = 100)
ibeta.est(x, tol = 1e-07)
zilogitnorm.est(x)
```

### **Arguments**

x A numerical vector with proportions, i.e. numbers in (0, 1) (zeros and ones are

not allowed).

tol The tolerance level up to which the maximisation stops.

maxiters The maximum number of iterations the Newton-Raphson algorithm will per-

form.

#### **Details**

Maximum likelihood estimation of the parameters of some distributions are performed, some of which use the Newton-Raphson. Some distributions and hence the functions do not accept zeros. "logitnorm.mle" fits the logistic normal, hence no Newton-Raphson is required and the "hypersecant01.mle" and "simplex.est" use the golden ratio search as is it faster than the Newton-Raphson (less computations). The "zilogitnorm.est" stands for the zero inflated logistic normal distribution. The "ibeta.est" fits the zero or the one inflated beta distribution.

### Value

A list including:

iters The number of iterations required by the Newton-Raphson.

loglik The value of the log-likelihood.

param The estimated parameters. In the case of "hypersecant01.est" this is called

"theta" as there is only one parameter.

MLE of the folded model for a given value of alpha  ${\it MLE~of~the~folded~model~for~a~given~value~of~\alpha}$ 

# Description

MLE of the folded model for a given value of  $\alpha$ .

# Usage

```
alpha.mle(x, a)
a.mle(a, x)
```

### **Arguments**

- x A matrix with the compositional data. No zero vaues are allowed.
- a A value of  $\alpha$ .

## **Details**

This is a function for choosing or estimating the value of  $\alpha$  in the folded model (Tsagris and Stewart, 2020). It is called by a.est.

If "alpha.mle" is called, a list including:

iters The nubmer of iterations the EM algorithm required.loglik The maximimized log-likelihood of the folded model.

p The estimated probability inside the simplex of the folded model.

mu The estimated mean vector of the folded model.

The estimated covariance matrix of the folded model.

If "a.mle" is called, the log-likelihood is returned only.

Multivariate analysis of variance

Multivariate analysis of variance

## **Description**

Multivariate analysis of variance with assuming equality of the covariance matrices.

```
maov(x, ina)
```

x A matrix containing Euclidean data.

ina A numerical or factor variable indicating the groups of the data.

#### **Details**

Multivariate analysis of variance assuming equality of the covariance matrices.

#### Value

A list including:

note A message stating whether the F or the chi-square approximation has been used.

result The test statistic and the p-value.

Multivariate analysis of variance (James test)
```

## **Description**

Multivariate analysis of variance without assuming equality of the covariance matrices.

```
maovjames(x, ina, a = 0.05)
```

## **Arguments**

X	A matrix	containing	Euclidean of	data.
/\	1 1 111441171	Commining	Dacinacan (	auu.

ina A numerical or factor variable indicating the groups of the data.

a The significance level, set to 0.005 by default.

### **Details**

Multivariate analysis of variance without assuming equality of the covariance matrices.

#### Value

A vector with the next 4 elements:

test The test statistic.

correction The value of the correction factor.

corr.critical The corrected critical value of the chi-square distribution.

p-value The p-value of the corrected test statistic.

Multivariate kernel density estimation

Multivariate kernel density estimation

## Description

Multivariate kernel density estimation.

# Usage

```
mkde(x, h, thumb = "silverman")
```

## **Arguments**

x A matrix with Euclidean (continuous) data.

h The bandwidh value. It can be a single value, which is turned into a vector and

then into a diagonal matrix, or a vector which is turned into a diagonal matrix.

thumb Do you want to use a rule of thumb for the bandwidth parameter? If no, leave it

"none", or else put "estim" for maximum likelihood cross-validation, "scott" or

"silverman" for Scott's and Silverman's rules of thumb respectively.

#### **Details**

The multivariate kernel density estimate is calculated with a (not necssarily given) bandwidth value. It is used a wrapper for the function comp.kerncontour.

# Value

A vector with the density estimates calculated for every vector.

## Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr> and Giorgos Athineou <gioathineou@gmail.com>.

```

Multivariate linear regression

Multivariate linear regression

### **Description**

Multivariate linear regression.

## Usage

```
multivreg(y, x, plot = TRUE, xnew = NULL)
```

# **Arguments**

y A matrix with the Eucldidean (continuous) data.

A matrix with the predictor variable(s), they have to be continuous.

plot Should a plot appear or not?

xnew If you have new data use it, otherwise leave it NULL.

#### **Details**

The classical multivariate linear regression model is obtained.

# Value

A list including:

suma A summary as produced by 1m, which includes the coefficients, their standard

error, t-values, p-values.

r. squared The value of the  $R^2$  for each univariate regression.

resid.out A vector with number indicating which vectors are potential residual outliers.

x.leverage A vector with number indicating which vectors are potential outliers in the pre-

dictor variables space.

out A vector with number indicating which vectors are potential outliers in the resid-

uals and in the predictor variables space.

est The predicted values if xnew is not NULL.

Multivariate normal random values simulation on the simplex

Multivariate normal random values simulation on the simplex

# Description

Multivariate normal random values simulation on the simplex.

# Usage

```
rcompnorm(n, m, s, type = "alr")
```

## **Arguments**

n	The sample size, a numerical value.
m	The mean vector in $\mathbb{R}^d$ .
S	The covariance matrix in $\mathbb{R}^d$ .
type	The alr (type = "alr") or the ilr (type = "ilr") is to be used for closing the Euclidean data onto the simplex.

# **Details**

The algorithm is straightforward, generate random values from a multivariate normal distribution in  $\mathbb{R}^d$  and brings the values to the simplex  $\mathbb{S}^d$  using the inverse of a log-ratio transformation.

### Value

A matrix with the simulated data.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

Multivariate or univariate regression with compositional data in the covariates side using the alpha-transformation 113

## References

comp.den(y)
ternary(y)</pre>
```

Multivariate or univariate regression with compositional data in the covariates side using the alpha-Multivariate or univariate regression with compositional data in the covariates side using the  $\alpha$ -transformation

# Description

Multivariate or univariate regression with compositional data in the covariates side using the  $\alpha$ -transformation.

# Usage

```
alfa.pcr(y, x, a, k, model = "gaussian", xnew = NULL)
```

# **Arguments**

У	A numerical vector containing the response variable values. They can be continuous, binary, discrete (counts). This can also be a vector with discrete values or a factor for the multinomial regression (model = "multinomial").
x	A matrix with the predictor variables, the compositional data.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
k	A number at least equal to 1. How many principal components to use.
model	The type of regression model to fit. The possible values are "gaussian", "multinomial", "binomial" and "poisson".
xnew	A matrix containing the new compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.

114Multivariate or univariate regression with compositional data in the covariates side using the alpha-transformation

#### **Details**

The  $\alpha$ -transformation is applied to the compositional data first ,the first k principal component scores are calcualted and used as predictor variables for a regression model. The family of distributions can be either, "normal" for continuous response and hence normal distribution, "binomial" corresponding to binary response and hence logistic regression or "poisson" for count response and poisson regression.

## Value

A list tincluding:

be	If linear regression was fitted, the regression coefficients of the k principal component scores on the response variable y.
mod	If another regression model was fitted its outcome as produced in the package ${f Rfast}$ .
per	The percentage of variance explained by the first k principal components.
vec	The first k principal components, loadings or eigenvectors. These are useful for future prediction in the sense that one needs not fit the whole model again.
est	If the argument "xnew" was given these are the predicted or estimated values, otherwise it is NULL.

```

Multivariate regression with compositional data

Multivariate regression with compositional data

## **Description**

Multivariate regression with compositional data.

## Usage

```
comp.reg(y, x, type = "classical", xnew = NULL, yb = NULL)
```

### **Arguments**

y A matrix with compsitional data. Zero values are not allowed.

x The predictor variable(s), they have to be continuous.

type The type of regression to be used, "classical" for standard multivariate regres-

sion, or "spatial" for the robust spatial median regression. Alternatively you can type "lmfit" for the fast classical multivariate regression that does not return

standard errors whatsoever.

xnew This is by default set to NULL. If you have new data whose compositional data

values you want to predict, put them here.

yb If you have already transformed the data using the additive log-ratio transforma-

tion, plut it here. Othewrise leave it NULL. This is intended to be used in the

function alfareg. tune in order to speed up the process.

### **Details**

The additive log-ratio transformation is applied and then the chosen multivariate regression is implemented. The alr is easier to explain than the ilr and that is why the latter is avoided here.

# Value

### A list including:

runtime The time required by the regression.

be The beta coefficients.

seb The standard error of the beta coefficients.

est The fitted values of xnew if xnew is not NULL.

mod1 <- comp.reg(y, x)
mod2 <- comp.reg(y, x, type = "spatial")</pre>
```

Multivariate skew normal random values simulation on the simplex

Multivariate skew normal random values simulation on the simplex

# Description

Multivariate skew normal random values simulation on the simplex.

# Usage

```
rcompsn(n, xi, Omega, alpha, dp = NULL, type = "alr")
```

# Arguments

n	The sample size, a numerical value.
xi	A numeric vector of length $\boldsymbol{d}$ representing the location parameter of the distribution.
Omega	A $d \times d$ symmetric positive-definite matrix of dimension.
alpha	A numeric vector which regulates the slant of the density.
dp	A list with three elements, corresponding to xi, Omega and alpha described above. The default value is FALSE. If dp is assigned, individual parameters must not be specified.
type	The alr (type = "alr") or the ilr (type = "ilr") is to be used for closing the Euclidean data onto the simplex.

### **Details**

The algorithm is straightforward, generate random values from a multivariate t distribution in  $\mathbb{R}^d$  and brings the values to the simplex  $\mathbb{S}^d$  using the inverse of a log-ratio transformation.

# Value

A matrix with the simulated data.

Naive Bayes classifiers for compositional data

Naive Bayes classifiers for compositional data

## **Description**

Naive Bayes classifiers for compositional data.

## Usage

```
comp.nb(xnew = NULL, x, ina, type = "beta")
```

# **Arguments**

xnew	A matrix with the new compositional predictor data whose class you want to predict. Zeros are not allowed
x	A matrix with the available compositional predictor data. Zeros are not allowed
ina	A vector of data. The response variable, which is categorical (factor is acceptable).
type	The type of naive Bayes, "beta", "logitnorm", "cauchy", "laplace", "gamma", "normlog" or "weibull". For the last 4 distributions, the negative of the logarithm of the compositional data is applied first.

### Value

ni

Depending on the classifier a list including (the ni and est are common for all classifiers):

A matrix with the shape parameters. shape A matrix with the scale parameters. scale A matrix with the mean parameters. expmu A matrix with the (MLE, hence biased) variance parameters. sigma A matrix with the location parameters (medians). location scale A matrix with the scale parameters. A matrix with the scale parameters. mean A matrix with the variance parameters. var A matrix with the "alpha" parameters. а b A matrix with the "beta" parameters.

The sample size of each group in the dataset.

est The estimated group of the xnew observations. It returns a numerical value back

regardless of the target variable being numerical as well or factor. Hence, it is suggested that you do \"as.numeric(ina)\" in order to see what is the predicted

class of the new data.

```

Naive Bayes classifiers for compositional data using the alpha-transformation  $Naive \ \ Bayes \ \ classifiers \ \ for \ \ compositional \ \ data \ \ using \ \ the \ \ \alpha-transformation$ 

# **Description**

Naive Bayes classifiers for compositional data using the  $\alpha$ -transformation.

## **Usage**

```
alfa.nb(xnew, x, ina, a, type = "gaussian")
```

# Arguments

xnew	A matrix with the new compositional predictor data whose class you want to predict. Zeros are allowed.
Х	A matrix with the available compositional predictor data. Zeros are allowed.
ina	A vector of data. The response variable, which is categorical (factor is acceptable).
а	This can be a vector of values or a single number.
type	The type of naive Bayes, "gaussian", "cauchy" or "laplace".

## **Details**

The  $\alpha$ -transformation is applied to the compositional and a naive Bayes classifier is employed.

# Value

A matrix with the estimated groups. One column for each value of  $\alpha$ .

#### Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

## References

Tsagris M.T., Preston S. and Wood A.T.A. (2011). A data-based power transformation for compositional data. In Proceedings of the 4th Compositional Data Analysis Workshop, Girona, Spain. https://arxiv.org/pdf/1106.1451.pdf

mod <- alfa.nb(x, x, a = c(0, 0.1, 0.2), ina )</pre>
```

Non linear least squares regression for compositional data

Non linear least squares regression for compositional data

# **Description**

Non linear least squares regression for compositional data.

## Usage

```
ols.compreg(y, x, B = 1, ncores = 1, xnew = NULL)
```

## **Arguments**

У	A matrix with the compositional data (dependent variable). Zero values are allowed.
Х	The predictor variable(s), they have to be continuous.
В	If B is greater than 1 bootstrap estimates of the standard error are returned. If $B=1$ , no standard errors are returned.
ncores	If ncores is 2 or more parallel computing is performed. This is to be used for the case of bootstrap. If B=1, this is not taken into consideration.
xnew	If you have new data use it, otherwise leave it NULL.

## **Details**

The ordinary least squares between the observed and the fitted compositional data is adopted as the objective function. This involves numerical optimization since the relationship is non linear. There is no log-likelihood.

#### Value

A list including:

runtime The time required by the regression.

beta The beta coefficients.

covbe The covariance matrix of the beta coefficients, if bootstrap is chosen, i.e. if B >

1.

est The fitted of xnew if xnew is not NULL.

Non parametric zero replacement strategies

Non parametric zero replacement strategies

# Description

Non parametric zero replacement strategies.

## Usage

```
zeroreplace(x, a = 0.65, delta = NULL, type = "multiplicative")
```

# Arguments

x	A matrix with the compositional data.
a	The replacement value ( $\delta$ ) will be "a" times the minimum value observed in the compositional data.
delta	Unless you specify the replacement value $\delta$ here.
type	This can be any of "multiplicative", "additive" or "simple". See the references for more details.

#### **Details**

The "additive" is the zero replacement strategy suggested in Aitchison (1986, pg. 269). All of the three strategies can be found in Martin-Fernandez et al. (2003).

#### Value

A matrix with the zero replaced compositional data.

```

124 Perturbation operation

Perturbation operation

Perturbation operation

## **Description**

Perturbation operation.

## Usage

```
perturbation(x, y, oper = "+")
```

## **Arguments**

x A matrix with the compositional data.

y Either a matrix with compositional data or a vector with compositional data. In

either case, the data may not be compositional data, as long as they non negative.

oper For the summation this must be "\*" and for the negation it must be "/". Accord-

ing to Aitchison (1986), multiplication is equal to summation in the log-space,

and division is equal to negation.

## **Details**

This is the perturbation operation defined by Aitchison (1986).

# Value

A matrix with the perturbed compositional data.

## Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>

## References

perturbation(x, y)
perturbation(x, y[1, ])</pre>
```

Plot of the LASSO coefficients

Plot of the LASSO coefficients

# **Description**

Plot of the LASSO coefficients.

## Usage

lassocoef.plot(lasso, lambda = TRUE)

## **Arguments**

lasso An object where you have saved the result of the LASSO regression. See the

examples for more details.

lambda If you want the x-axis to contain the logarithm of the penalty parameter  $\log(\lambda)$ 

set this to TRUE. Otherwise the x-axis will contain the  $L_1$ -norm of the coeffi-

cients.

#### **Details**

This function plots the  $L_2$ -norm of the coefficients of each predictor variable versus the  $\log(\lambda)$  or the  $L_1$ -norm of the coefficients. This is the same plot as the one produced by the glmnet package with type.coef = "2norm".

### Value

A plot of the  $L_2$ -norm of the coefficients of each predictor variable (y-axis) versus the  $L_1$ -norm of all the coefficients (x-axis).

#### Author(s)

Michail Tsagris and Abdulaziz Alenazi.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr> and Abdulaziz Alenazi@nbu.edu.sa>. <a.alenazi@nbu.edu.sa>.

Power operation

## **Examples**

```
y <- as.matrix(iris[, 1:4])
y <- y / rowSums(y)
x <- matrix( rnorm(150 * 30), ncol = 30 )
a <- lasso.klcompreg(y, x)
lassocoef.plot(a)
b <- lasso.compreg(y, x)
lassocoef.plot(b)</pre>
```

Power operation

Power operation

# **Description**

Power operation.

## Usage

```
pow(x, a)
```

## Arguments

x A matrix with the compositional data.

a Either a vector with numbers of a single number.

## **Details**

This is the power operation defined by Aitchison (1986). It is also the starting point of the  $\alpha$ -transformation.

### Value

A matrix with the power transformed compositional data.

# Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>

### References

Principal component analysis

Principal component analysis

# Description

Principal component analysis.

## Usage

```
logpca(x, center = TRUE, scale = TRUE, k = NULL, vectors = FALSE)
```

# **Arguments**

x	A matrix with the compositional data. Zero values are not allowed.
center	Do you want your data centered? TRUE or FALSE.
scale	Do you want each of your variables scaled, i.e. to have unit variance? TRUE or FALSE.
k	If you want a specific number of eigenvalues and eigenvectors set it here, otherwise all eigenvalues (and eigenvectors if requested) will be returned.
vectors	Do you want the eigenvectors be returned? By dafault this is FALSE.

# **Details**

The logarithm is applied to the compositional data and PCA is performed.

# Value

A list including:

values The eigenvalues. vectors The eigenvectors.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

Principal component analysis using the alpha-transformation Principal component analysis using the  $\alpha$ -transformation

# Description

Principal component analysis using the  $\alpha$ -transformation.

# Usage

```
alfa.pca(x, a, center = TRUE, scale = TRUE, k = NULL, vectors = FALSE)
```

# Arguments

X	A matrix with the compositional data. Zero values are allowed. In that case "a" should be positive.
a	The value of $\alpha$ to use in the $\alpha$ -transformation.
center	Do you want your data centered? TRUE or FALSE.
scale	Do you want each of your variables scaled, i.e. to have unit variance? TRUE or FALSE.
k	If you want a specific number of eigenvalues and eigenvectors set it here, otherwise all eigenvalues (and eigenvectors if requested) will be returned.
vectors	Do you want the eigenvectors be returned? By dafault this is FALSE.

# **Details**

The  $\alpha$ -transformation is applied to the compositional data and then PCA is performed. Note however, that the right multiplication by the Helmert sub-matrix is not applied in order to be in accordance with Aitchison (1983). When  $\alpha = 0$ , this results to the PCA proposed by Aitchison (1983).

# Value

A list including:

values The eigenvalues.
vectors The eigenvectors.

Principal component generalised linear models

Principal component generalised linear models

# Description

Principal component generalised linear models.

# Usage

```
pcr(y, x, k = 1, xnew = NULL)
glm.pcr(y, x, k = 1, xnew = NULL)
```

## **Arguments**

У	A numerical vector, a real values vector or a numeric vector with 0 and 1 (binary) or a vector with discrete (count) data.
Х	A matrix with the predictor variable(s), they have to be continuous.
k	A number greater than or equal to 1. How many principal components to use. In the case of "pcr" this can be a single number or a vector. In the second case you get results for the sequence of principal components.
xnew	If you have new data use it, otherwise leave it NULL.

## **Details**

Principal component regression is performed with linear, binary logistic or Poisson regression, depending on the nature of the response variable. The principal components of the cross product of the independent variables are obtained and classical regression is performed. This is used in the function alfa.pcr.

#### Value

# A list including:

be	The beta coefficients of the predictor variables computed via the principcal components if "pcr" is used.
model	The summary of the logistic or Poisson regression model.
per	The percentage of variance of the predictor variables retained by the k principal components.

The principal components, the loadings.

est The fitted or the predicted values (if xnew is not NULL).

Projection pursuit regression for compositional data

Projection pursuit regression for compositional data

# **Description**

Projection pursuit regression for compositional data.

# Usage

```
comp.ppr(y, x, nterms = 3, type = "alr", xnew = NULL, yb = NULL )
```

# Arguments

A matrix with the compositional data.
A matrix with the continuous predictor variables or a data frame including categorical predictor variables.
The number of terms to include in the final model.
Either "alr" or "ilr" corresponding to the additive or the isometric log-ratio transformation respectively.
If you have new data use it, otherwise leave it NULL.
If you have already transformed the data using a log-ratio transformation put it here. Othewrise leave it NULL.

## **Details**

This is the standard projection pursuit. See the built-in function "ppr" for more details.

# Value

# A list includign:

runtime The runtime of the regression.

mod The produced model as returned by the function "ppr".

est The fitted values of xnew if xnew is not NULL.

Proportionality correlation coefficient matrix

Proportionality correlation coefficient matrix

## **Description**

Proportionality correlation coefficient matrix.

## Usage

pcc(x)

## **Arguments**

X

A numerical matrix with the compositional data. Zeros are not allowed as the logarithm is applied.

### **Details**

The function returns the proportionality correlation coefficient matrix. See Lovell et al. (2015) for more information.

## Value

A matrix with the alr transformed data (if alr is used) or with the compositional data (if the alrinv is used).

## Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

```

```
Quasi binomial regression for proportions

Quasi binomial regression for proportions
```

# Description

Quasi binomial regression for proportions.

## Usage

```
propreg(y, x, varb = "quasi", tol = 1e-07, maxiters = 100)
propregs(y, x, varb = "quasi", tol = 1e-07, logged = FALSE, maxiters = 100)
```

### **Arguments**

V	A numerical	vector proportions.	0s and	1s are allowed.

x For the "propreg" a matrix with data, the predictor variables. This can be a matrix or a data frame. For the "propregs" this must be a numerical matrix, where each columns denotes a variable.

The tolerance value to terminate the Newton-Raphson algorithm. This is set to  $10^{-9}$  by default.

varb The type of estimate to be used in order to estimate the covariance matrix of the

regression coefficients. There are two options, either "quasi" (default value) or

"glm". See the references for more information.

logged Should the p-values be returned (FALSE) or their logarithm (TRUE)?

maxiters The maximum number of iterations before the Newton-Raphson is terminated

automatically.

#### **Details**

We are using the Newton-Raphson, but unlike R's built-in function "glm" we do no checks and no extra calculations, or whatever. Simply the model. The "propregs" is to be used for very many univariate regressions. The "x" is a matrix in this case and the significance of each variable (column of the matrix) is tested. The function accepts binary responses as well (0 or 1).

## Value

For the "propreg" function a list including:

iters The number of iterations required by the Newton-Raphson.

varb The covariance matrix of the regression coefficients.

phi The phi parameter is returned if the input argument "varb" was set to "glm",

othwerise this is NULL.

info A table similar to the one produced by "glm" with the estimated regression co-

efficients, their standard error, Wald test statistic and p-values.

For the "propregs" a two-column matrix with the test statistics (Wald statistic) and the associated p-values (or their loggarithm).

b <- propregs(y, x)
mean(b[, 2] < 0.05)</pre>
```

Regression with compositional data using the alpha-transformation  $Regression \ with \ compositional \ data \ using \ the \ \alpha\text{-}transformation$ 

# Description

Regression with compositional data using the  $\alpha$ -transformation.

# Usage

```
alfa.reg(y, x, a, xnew = NULL, yb = NULL, seb = FALSE)
```

# **Arguments**

У	A matrix with the compositional data.
x	A matrix with the continuous predictor variables or a data frame including categorical predictor variables.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied and the solution exists in a closed form, since it the classical mutivariate regression.
xnew	If you have new data use it, otherwise leave it NULL.
yb	If you have already transformed the data using the $\alpha$ -transformation with the same $\alpha$ as given in the argument "a", put it here. Othewrise leave it NULL.
	This is intended to be used in the function alfareg. tune in order to speed up the process. The time difference in that function is small for small samples. But, if you have a few thousands and or a few more components, there will be bigger differences.
seb	Do you want the standard error of the coefficients to be returned? In the alfareg.tune function this extra computation that is avoided can save some time.

# **Details**

The  $\alpha$ -transformation is applied to the compositional data first and then multivariate regression is applied. This involves numerical optimisation.

136Regularised and flexible discriminant analysis for compositional data using the alpha-transformation

#### Value

A list including:

runtime The time required by the regression.

be The beta coefficients.

seb The standard error of the beta coefficients.

est The fitted values for xnew if xnew is not NULL.

## Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr> and Giorgos Athineou <gioathineou@gmail.com>.

Regularised and flexible discriminant analysis for compositional data using the alpha-transformation Regularised and flexible discriminant analysis for compositional data using the  $\alpha$ -transformation

# Description

Regularised and flexible discriminant analysis for compositional data using the  $\alpha$ -transformation.

Regularised and flexible discriminant analysis for compositional data using the alpha-transformation 137

## Usage

```
alfa.rda(xnew, x, ina, a, gam = 1, del = 0)
alfa.fda(xnew, x, ina, a)
```

## **Arguments**

xnew	A matrix with the new compositional data whose group is to be predicted. Zeros are allowed, but you must be carefull to choose strictly positive vealues of $\alpha$ .
x	A matrix with the available compositional data. Zeros are allowed, but you must be carefull to choose strictly positive vcalues of $\alpha$ .
ina	A group indicator variable for the avaiable data.
а	The value of $\alpha$ for the $\alpha$ -transformation.
gam	This is a number between 0 and 1. It is the weight of the pooled covariance and the diagonal matrix.
del	This is a number between 0 and 1. It is the weight of the LDA and QDA.

#### **Details**

For the alfa.rda, the covariance matrix of each group is calcualted and then the pooled covariance matrix. The spherical covariance matrix consists of the average of the pooled variances in its diagonal and zeros in the off-diagonal elements. gam is the weight of the pooled covariance matrix and 1-gam is the weight of the spherical covariance matrix, Sa = gam \* Sp + (1-gam) \* sp. Then it is a compromise between LDA and QDA. del is the weight of Sa and 1-del the weight of each group covariance group. This function is a wrapper for alfa.rda.

For the alfa.fda a flexible discriminant analysis is performed. See the R package **fda** for more details.

### Value

For the alfa.rda a list including:

prob The estimated probabilities of the new data of belonging to each group.

scores The estimated socres of the new data of each group.

est The estimated group membership of the new data.

For the alfa.fda a list including:

mod A fda object as returned by the command fda of the R package mda.

est The estimated group membership of the new data.

140 Ridge regression

|--|--|

# **Description**

Ridge regression.

## Usage

```
ridge.reg(y, x, lambda, B = 1, xnew = NULL)
```

# **Arguments**

у	A real valued vector. If it contains percentages, the logit transformation is applied.
x	A matrix with the predictor variable(s), they have to be continuous.
lambda	The value of the regularisation parameter $\lambda$ .
В	If $B = 1$ (default value) no bootstrpa is performed. Otherwise bootstrap standard errors are returned.
xnew	If you have new data whose response value you want to predict put it here, otherwise leave it as is.

# **Details**

This is used in the function alfa.ridge. There is also a built-in function available from the MASS library, called lm.ridge.

## Value

A list including:

beta The beta coefficients.

seb The standard error of the coefficiens. If B > 1 the bootstrap standard errors will

be returned.

est The fitted or the predicted values (if xnew is not NULL).

Ridge regression with compositional data in the covariates side using the alpha-transformation  ${\it Ridge\ regression\ with\ compositional\ data\ in\ the\ covariates\ side\ using} {\it the\ \alpha-transformation}$ 

# **Description**

Ridge regression with compositional data in the covariates side using the  $\alpha$ -transformation.

# Usage

```
alfa.ridge(y, x, a, lambda, B = 1, xnew = NULL)
```

## **Arguments**

У	A numerical vector containing the response variable values. If they are percentages, they are mapped onto $R$ using the logit transformation.
x	A matrix with the predictor variables, the compositional data. Zero values are allowed, but you must be carefull to choose strictly positive vcalues of $\alpha$ .
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
lambda	The value of the regularisation parameter, $\lambda$ .
В	If $B > 1$ bootstrap estimation of the standard errors is implemented.
xnew	A matrix containing the new compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.

## Details

The  $\alpha$ -transformation is applied to the compositional data first and then ridge components regression is performed.

## Value

The output of the ridge.reg.

Simulation of compositional data from Gaussian mixture models

Simulation of compositional data from Gaussian mixture models

# **Description**

Simulation of compositional data from Gaussian mixture models.

# Usage

```
rmixcomp(n, prob, mu, sigma, type = "alr")
```

## **Arguments**

n	The sample size
prob	A vector with mixing probabilities. Its length is equal to the number of clusters.
mu	A matrix where each row corresponds to the mean vector of each cluster.
sigma	An array consisting of the covariance matrix of each cluster.
type	Should the additive ("type=alr") or the isometric (type="ilr") log-ration be used? The default value is for the additive log-ratio transformation.

### **Details**

A sample from a multivariate Gaussian mixture model is generated.

# Value

A list including:

id A numeric variable indicating the cluster of simulated vector.

x A matrix containing the simulated compositional data. The number of dimen-

sions will be + 1.

# Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

Simulation of compositional data from the Flexible Dirichlet distribution

Simulation of compositional data from the Flexible Dirichlet distribution

# **Description**

Simulation of compositional data from the Flexible Dirichlet distribution.

#### **Usage**

```
rfd(n, alpha, prob, tau)
```

# **Arguments**

n The sample size.

alpha A vector of the non-negative  $\alpha$  parameters.

prob A vector of the clusters' probabilities that must sum to one.

tau The positive scalar tau parameter.

# **Details**

For more information see the references.

# Value

A matrix with compositional data.

#### Author(s)

Michail Tsagris ported from the R package FlexDir. <mtsagris@uoc.gr>.

prob <- c(0.25, 0.25, 0.5)
x <- rfd(100, alpha, prob, 7)
```

Simulation of compositional data from the folded normal distribution Simulation of compositional data from the folded model normal distribution

# Description

Simulation of compositional data from the folded model normal distribution.

# Usage

```
rfolded(n, mu, su, a)
```

# **Arguments**

n	The sample size.		
mu	The mean vector.		
su	The covariance matrix.		
a	The value of $\alpha$ .		

# **Details**

A sample from the folded model is generated.

#### Value

A matrix with compositional data.

## Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

# References

Tsagris Michail and Stewart Connie (2020). A folded model for compositional data analysis. Australian and New Zealand Journal of Statistics, 62(2): 249-277. https://arxiv.org/pdf/1802.07330.pdf

## **Examples**

Spatial median regression

Spatial median regression

# Description

Spatial median regression with Euclidean data.

# Usage

```
spatmed.reg(y, x, xnew = NULL, tol = 1e-07, ses = FALSE)
```

# Arguments

У	A matrix with the compositional data. Zero values are not allowed.
X	The predictor variable(s), they have to be continuous.
xnew	If you have new data use it, otherwise leave it NULL.
tol	The threshold upon which to stop the iterations of the Newton-Rapshon algorithm.
ses	If you want to extract the standard errors of the parameters, set this to TRUE. Be careful though as this can slow down the algorithm dramatically. In a run example with 10,000 observations and 10 variables for y and 30 for x, when ses = FALSE the algorithm can take 0.20 seconds, but when ses = TRUE it can go up to 140 seconds.

Ternary diagram 149

## **Details**

The objective function is the minimization of the sum of the absolute residuals. It is the multivariate generalization of the median regression. This function is used by comp.reg.

#### Value

A list including:

iter The number of iterations that were required.

runtime The time required by the regression.

be The beta coefficients.

seb The standard error of the beta coefficients is returned if ses=TRUE and NULL

otherwise.

est The fitted of xnew if xnew is not NULL.

```

## **Examples**

```
library(MASS)
x <- as.matrix(iris[, 3:4])
y <- as.matrix(iris[, 1:2])
mod1 <- spatmed.reg(y, x)
mod2 <- multivreg(y, x, plot = FALSE)</pre>
```

Ternary diagram

Ternary diagram

# **Description**

Ternary diagram.

# Usage

```
ternary(x, means = TRUE, pca = FALSE, colour = NULL)
```

Ternary diagram

# **Arguments**

x	A matrix with the compositional data.
means	A boolean variable. Should the closed geometric mean and the arithmetic mean appear (TRUE) or not (FALSE)?.
pca	Should the first PCA calculated Aitchison (1983) described appear? If yes, then this should be TRUE, or FALSE otherwise.
colour	If you want the points to appear in different colour put a vector with the colour numbers or colours.

## **Details**

The first PCA is calcualte using the centred log-ratio transformation as Aitchison (1983, 1986) suggested. If the data contain zero values, the first PCA will not be plotted. There are two ways to create a ternary graph. The one I used here, where each edge is equal to 1 and the one Aitchison (1986) uses. For every given point, the sum of the distances from the edges is equal to 1. Zeros in the data appear with green circles in the triangle and you will also see NaN in the closed geometric mean.

## Value

The ternary plot and a 2-row matrix with the means. The closed geometric and the simple arithmetic mean vector and or the first principcal component will appear as well if the user has asked for them.

Ternary diagram of regression models

Ternary diagram of regression models

# Description

Ternary diagram of regression models.

# Usage

```
ternary.reg(y, est, id, labs)
```

# **Arguments**

У	A matrix with the compositional data.
est	A matrix with all fitted compositional data for all regression models, one under the other.
id	A vector indicating the regression model of each fitted compositional data set.

labs The names of the regression models to appea in the legend.

# **Details**

The points first appear on the ternary plot. Then, the fitted compositional data appear with different lines for each regression model.

# Value

The ternary plot and lines for the fitted values of each regression model.

The additive log-ratio transformation and its inverse

The additive log-ratio transformation and its inverse

# Description

The additive log-ratio transformation and its inverse.

# Usage

```
alr(x)
alrinv(y)
```

## **Arguments**

- x A numerical matrix with the compositional data.
- y A numerical matrix with data to be closed into the simplex.

# **Details**

The additive log-ratio transformation with the first component being the common divisor is applied. The inverse of this transformation is also available. This means that no zeros are allowed.

## Value

A matrix with the alr transformed data (if alr is used) or with the compositional data (if the alrinv is used).

# Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>

# References

Aitchison J. (1986). The statistical analysis of compositional data. Chapman & Hall.

```

The alpha-distance 153

# **Examples**

```
library(MASS)
x <- as.matrix(fgl[, 2:9])
x <- x / rowSums(x)
y <- alr(x)
x1 <- alrinv(y)</pre>
```

The alpha-distance

*The*  $\alpha$ *-distance* 

# **Description**

This is the Euclidean (or Manhattan) distance after the  $\alpha$ -transformation has been applied.

# Usage

```
alfadist(x, a, type = "euclidean", square = FALSE)
alfadista(xnew, x, a, type = "euclidean", square = FALSE)
```

# **Arguments**

xnew	A matrix or a vector with new compositional data.
x	A matrix with the compositional data.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ , the isometric log-ratio transformation is applied.
type	Which type distance do you want to calculate after the $\alpha$ -transformation, "euclidean", or "manhattan".
square	In the case of the Euclidean distance, you can choose to return the squared distance by setting this TRUE.

# **Details**

The  $\alpha$ -transformation is applied to the compositional data first and then the Euclidean or the Manhattan distance is calculated.

## Value

For "alfadist" a matrix including the pairwise distances of all observations or the distances between xnew and x. For "alfadista" a matrix including the pairwise distances of all observations or the distances between xnew and x.

# Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

The alpha-k-NN regression for compositional response data  $\textit{The $\alpha$-k-NN$ regression for compositional response data}$ 

# **Description**

The  $\alpha$ -k-NN regression for compositional response data.

# Usage

```
aknn.reg(xnew, y, x, a = seq(0.1, 1, by = 0.1), k = 2:10, apostasi = "euclidean", rann = FALSE)
```

## **Arguments**

xnew	A matrix with the new predictor variables whose compositions are to be predicted.
У	A matrix with the compositional response data. Zeros are allowed.
X	A matrix with the available predictor variables.
a	The value(s) of $\alpha$ . Either a single value or a vector of values. As zero values in the compositional data are allowed, you must be careful to choose strictly positive vcalues of $\alpha$ . However, if negative values are passed, the positive ones are used only.
k	The number of nearest neighbours to consider. It can be a single number or a vector.
apostasi	The type of distance to use, either "euclidean" or "manhattan".

rann

If you have large scale datasets and want a faster k-NN search, you can use kd-trees implemented in the R package "RANN". In this case you must set this argument equal to TRUE. Note however, that in this case, the only available distance is by default "euclidean".

#### **Details**

The  $\alpha$ -k-NN regression for compositional response variables is applied.

#### Value

A list with the estimated compositional response data for each value of  $\alpha$  and k.

## Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

```
y <- as.matrix( iris[, 1:3] )
y <- y / rowSums(y)
x <- iris[, 4]
mod <- aknn.reg(x, y, x, a = c(0.4, 0.5), k = 2:3, apostasi = "euclidean")</pre>
```

The alpha-k-NN regression with compositional predictor variables  ${\it The} \,\, \alpha\text{-}k\text{-}NN \,\, regression \,\, with \,\, compositional \,\, predictor \,\, variables$ 

# **Description**

The  $\alpha$ -k-NN regression with compositional predictor variables.

# Usage

```
alfa.knn.reg(xnew, y, x, a = 1, k = 2:10, apostasi = "euclidean", method = "average")
```

## **Arguments**

xnew	A matrix with the new compositional predictor variables whose response is to be predicted. Zeros are allowed.
У	The response variable, a numerical vector.
X	A matrix with the available compositional predictor variables. Zeros are allowed.
a	A single value of $\alpha$ . As zero values in the compositional data are allowed, you must be careful to choose strictly positive vealues of $\alpha$ . If negative values are passed, the positive ones are used only. If the data are already alphatransformed, you can make this NULL.
k	The number of nearest neighbours to consider. It can be a single number or a vector.
apostasi	The type of distance to use, either "euclidean" or "manhattan".
method	If you want to take the average of the reponses of the k closest observations, type "average". For the median, type "median" and for the harmonic mean, type "harmonic".

## **Details**

The  $\alpha$ -k-NN regression with compositional predictor variables is applied.

#### Value

A matrix with the estimated response data for each value of k.

```

The alpha-transformation

*The*  $\alpha$ *-transformation* 

## **Description**

The  $\alpha$ -transformation.

### Usage

```
alfa(x, a, h = TRUE)
 alef(x, a)
```

# Arguments

x A matrix with the compositional data.

The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If  $\alpha = 0$  the isometric log-ratio

transformation is applied.

h A boolean variable. If is TRUE (default value) the multiplication with the Helmert sub-matrix will take place. When  $\alpha=0$  and h = FALSE, the result

Helmert sub-matrix will take place. When  $\alpha=0$  and h=FALSE, the result is the centred log-ratio transformation (Aitchison, 1986). In general, when h=FALSE the resulting transformation maps the data onto a singual space. The sum of the vectors is equal to 0. Hence, from the simplex constraint the data go

to another constraint.

#### **Details**

The  $\alpha$ -transformation is applied to the compositional data. The command "alef" is the same as "alfa(x, a, h = FALSE)", but reurns a different element as well and is necessary for the functions a.est, a.mle and alpha.mle.

# Value

A list including:

sa	The logarithm of the Jacobian determinant of the $\alpha$ -transformation.	This is used

in the "profile" function to speed up the computations.

sk If the "alef" was called, this will return the sum of the  $\alpha$ -power transformed data,

prior to being normalised to sum to 1. If  $\alpha = 0$ , this will not be returned.

aff The  $\alpha$ -transformed data.

The Frechet mean for compositional data

The Frechet mean for compositional data

# Description

Mean vector or matrix with mean vectors of compositional data using the  $\alpha$ -transformation.

# Usage

```
frechet(x, a)
```

# **Arguments**

а

x A matrix with the compositional data.

The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If  $\alpha=0$  the isometric log-ratio transformation is applied and the closed geometric mean is calculated. You can also provide a sequence of values of alpha and in this case a matrix of Frechet means will be returned.

# **Details**

The power transformation is applied to the compositional data and the mean vector is calculated. Then the inverse of it is calculated and the inverse of the power transformation applied to the last vector is the Frechet mean.

#### Value

If  $\alpha$  is a single value, the function will return a vector with the Frechet mean for the given value of  $\alpha$ . Otherwise the function will return a matrix with the Frechet means for each value of  $\alpha$ .

The k-nearest neighbours using the alpha-distance

The k-nearest neighbours using the  $\alpha$ -distance

# Description

The k-nearest neighbours using the  $\alpha$ -distance.

## Usage

```
alfann(xnew, x, a, k = 10, rann = FALSE)
```

# Arguments

xnew	A matrix or a vector with new compositional data.
x	A matrix with the compositional data.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ , the isometric log-ratio transformation is applied.
k	The number of nearest neighbours to search for.
rann	If you have large scale datasets and want a faster k-NN search, you can use kd-trees implemented in the R package "RANN". In this case you must set this argument equal to TRUE. Note however, that in this case, the only available distance is by default "euclidean".

### **Details**

The  $\alpha$ -transformation is applied to the compositional data first and the indices of the k-nearest neighbours using the Euclidean distance are returned.

#### Value

A matrix including the indices of the nearest neighbours of each xnew from x.

library(MASS)
xnew <- as.matrix(fgl[1:20, 2:9])
xnew <- xnew / rowSums(xnew)
x <- as.matrix(fgl[-c(1:20), 2:9])
x <- x / rowSums(x)
b <- alfann(xnew, x, a = 0.1, k = 10)</pre>
```

```
The k-NN algorithm for compositional data The \ k\text{-NN algorithm for compositional data}
```

# Description

The k-NN algorithm for compositional data with and without using the power transformation.

#### **Usage**

```
comp.knn(xnew, x, ina, a = 1, k = 5, type = "S", apostasi = "ESOV", mesos = TRUE) alfa.knn(xnew, x, ina, a = 1, k = 5, type = "S", mesos = TRUE, apostasi = "euclidean", rann = FALSE)
```

# **Arguments**

xnew	A matrix with the new compositional data whose group is to be predicted. Zeros are allowed, but you must be carefull to choose strictly positive values of $\alpha$ or not to set apostasi= "Ait".
x	A matrix with the available compositional data. Zeros are allowed, but you must be carefull to choose strictly positive vcalues of $\alpha$ or not to set apostasi= "Ait".
ina	A group indicator variable for the available data.
a	The value of $\alpha$ . As zero values in the compositional data are allowed, you must be careful to choose strictly positive vcalues of $\alpha$ . You have the option to put a = NULL. In this case, the xnew and x are assumed to be the already $\alpha$ -transformed data.
k	The number of nearest neighbours to consider. It can be a single number or a vector.
type	This can be either "S" for the standard k-NN or "NS" for the non standard (see details).
apostasi	The type of distance to use. For the compk.knn this can be one of the following: "ESOV", "taxicab", "Ait", "Hellinger", "angular" or "CS". See the references for them. For the alfa.knn this can be either "euclidean" or "manhattan".
mesos	This is used in the non standard algorithm. If TRUE, the arithmetic mean of the distances is calulated, otherwise the harmonic mean is used (see details).
rann	If you have large scale datasets and want a faster k-NN search, you can use kd-trees implemented in the R package "RANN". In this case you must set this argument equal to TRUE. Note however, that in this case, the only available distance is by default "euclidean".

#### **Details**

The k-NN algorithm is applied for the compositional data. There are many metrics and possibilities to choose from. The standard algorithm finds the k nearest observations to a new observation and allocates it to the class which appears most times in the neighbours. The non standard algorithm is slower but perhaps more accurate. For every group is finds the k nearest neighbours to the new observation. It then computes the arithmetic or the harmonic mean of the distances. The new point is allocated to the class with the minimum distance.

## Value

A vector with the estimated groups.

The pivot coordinate transformation and its inverse

The pivot coordinate transformation and its inverse

# **Description**

The pivot coordinate transformation and its inverse.

#### Usage

```
pivot(x)
pivotinv(y)
```

# Arguments

x A numerical matrix with the compositional data.

y A numerical matrix with data to be closed into the simplex.

Total variability 169

# **Details**

The pivot coordinate transformation and its inverse are computed. This means that no zeros are allowed.

#### Value

A matrix with the alr transformed data (if pivot is used) or with the compositional data (if the pivotinv is used).

## Author(s)

Michail Tsagris

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

x <- as.matrix(fgl[, 2:9])
x <- x / rowSums(x)
y <- pivot(x)
x1 <- alrinv(y)</pre>
```

Total variability

Total variability

# Description

Total variability.

# Usage

```
totvar(x, a = 0)
```

## **Arguments**

x A numerical matrix with the compositional data.

The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If  $\alpha=0$  the centred log-ratio transformation is used.

#### **Details**

The  $\alpha$ -transformation is applied and the sum of the variances of the transformed variables is calculated. This is the total variability. Aitchison (1986) used the centred log-ratio transformation, but we have extended it to cover more geometries, via the  $\alpha$ -transformation.

#### Value

The total variability of the data in a given geometry as dictated by the value of  $\alpha$ .

Tuning of the alpha generalised correlations between two compositional datasets

Tuning of the alpha generalised correlations between two compositional datasets

# **Description**

Tuning of the alpha generalised correlations between two compositional datasets.

# Usage

```
acor.tune(y, x, a, type = "dcor")
```

# **Arguments**

У	A matrix with the compositional data.
x	A matrix with the compositional data.
a	The range of values of the power transformation to search for the optimal one. If zero values are present it has to be greater than $0$ .
type	the type of correlation to compute, the distance correlation ("edist"), the canonical correlation type 1 ("cancor1") or the canonical correlation type 2 ("cancor2"). See details for more information.

## **Details**

The  $\alpha$ -transformation is applied to each composition and then the distance correlation or the canonical correlation is computed. If type = "cancor1" the function returns the value of  $\alpha$  that maximizes the product of the eigenvalues. If type = "cancor2" the function returns the value of  $\alpha$  that maximizes the the largest eigenvalue.

## Value

A list including:

alfa The optimal value of  $\alpha$ .

acor The maximum value of the acor.

runtime The runtime of the optimization

Tuning of the bandwidth h of the kernel using the maximum likelihood cross validation

Tuning of the bandwidth h of the kernel using the maximum likelihood

cross validation

# **Description**

Tuning of the bandwidth h of the kernel using the maximum likelihood cross validation.

# Usage

```
mkde.tune( x, low = 0.1, up = 3, s = cov(x) )
```

# **Arguments**

x A matrix with Euclidean (continuous) data.

The minimum value to search for the optimal bandwidth value.

The maximum value to search for the optimal bandwidth value.

s A covariance matrix. By default it is equal to the covariance matrix of the data,

but can change to a robust covariance matrix, MCD for example.

#### **Details**

Maximum likelihood cross validation is applied in order to choose the optimal value of the bandwidth parameter. No plot is produced.

## Value

A list including:

hopt The optimal bandwidth value.

maximum The value of the pseudo-log-likelihood at that given bandwidth value.

Tuning of the divergence based regression for compositional data with compositional data in the covar Tuning of the divergence based regression for compositional data with compositional data in the covariates side using the  $\alpha$ -transformation

# **Description**

Tuning of the divergence based regression for compositional data with compositional data in the covariates side using the  $\alpha$ -transformation.

# Usage

```
klalfapcr.tune(y, x, covar = NULL, nfolds = 10, maxk = 50, a = seq(-1, 1, by = 0.1), folds = NULL, graph = FALSE, tol = 1e-07, maxiters = 50, seed = FALSE)
```

# **Arguments**

у	A numerical matrix with compositional data with or without zeros.
X	A matrix with the predictor variables, the compositional data. Zero values are allowed.
covar	If you have other continuous covariates put themn here.
nfolds	The number of folds for the K-fold cross validation, set to 10 by default.
maxk	The maximum number of principal components to check.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
graph	If graph is TRUE (default value) a filled contour plot will appear.
tol	The tolerance value to terminate the Newton-Raphson procedure.
maxiters	The maximum number of Newton-Raphson iterations.
seed	If seed is TRUE the results will always be the same.

Tuning of the divergence based regression for compositional data with compositional data in the covariates side using the alpha-tra

#### **Details**

The M-fold cross validation is performed in order to select the optimal values for  $\alpha$  and k, the number of principal components. The  $\alpha$ -transformation is applied to the compositional data first, the first k principal component scores are calcualted and used as predictor variables for the Kullback-Leibler divergence based regression model. This procedure is performed M times during the M-fold cross validation.

#### Value

A list including:

mspe A list with the KL divergence for each value of  $\alpha$  and k in every fold.

performance A matrix with the KL divergence for each value of  $\alpha$  averaged over all folds. If

graph is set to TRUE this matrix is plotted.

best.perf The minimum KL divergence.

params The values of  $\alpha$  and k corresponding to the minimum KL divergence.

Tuning of the k-NN algorithm for compositional data  $Tuning\ of\ the\ k-NN\ algorithm\ for\ compositional\ data$ 

## **Description**

Tuning of the k-NN algorithm for compositional data with and without using the power or the  $\alpha$ -transformation. In addition, estimation of the rate of correct classification via M-fold cross-validation.

## Usage

```
compknn.tune(x, ina, nfolds = 10, k = 2:5, type= "S", mesos = TRUE,
a = seq(-1, 1, by = 0.1), apostasi = "ESOV", folds = NULL,
stratified = FALSE, seed = FALSE, graph = FALSE)

alfaknn.tune(x, ina, nfolds = 10, k = 2:5, type = "S", mesos = TRUE,
a = seq(-1, 1, by = 0.1), apostasi = "euclidean", rann = FALSE, folds = NULL,
stratified = FALSE, seed = FALSE, graph = FALSE)
```

#### **Arguments**

X	A matrix with the available compositional data. Zeros are allowed, but you must be careful to choose strictly positive values of $\alpha$ or not to set apostasi= "Ait".
ina	A group indicator variable for the available data.
nfolds	The number of folds to be used. This is taken into consideration only if the folds argument is not supplied.
k	A vector with the nearest neighbours to consider.
type	This can be either "S" for the standard k-NN or "NS" for the non standard (see details).
mesos	This is used in the non standard algorithm. If TRUE, the arithmetic mean of the distances is calculated, otherwise the harmonic mean is used (see details).
а	A grid of values of $\alpha$ to be used only if the distance chosen allows for it.
apostasi	The type of distance to use. For the compk.knn this can be one of the following: "ESOV", "taxicab", "Ait", "Hellinger", "angular" or "CS". See the references for them. For the alfa.knn this can be either "euclidean" or "manhattan".
rann	If you have large scale datasets and want a faster k-NN search, you can use kd-trees implemented in the R package "RANN". In this case you must set this argument equal to TRUE. Note however, that in this case, the only available distance is by default "euclidean".
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
stratified	Do you want the folds to be created in a stratified way? TRUE or FALSE.
seed	If seed is TRUE the results will always be the same.
graph	If set to TRUE a graph with the results will appear.

#### **Details**

The k-NN algorithm is applied for the compositional data. There are many metrics and possibilities to choose from. The standard algorithm finds the k nearest observations to a new observation and allocates it to the class which appears most times in the neighbours. The non standard algorithm is slower but perhaps more accurate. For every group is finds the k nearest neighbours to the new observation. It then computes the arithmetic or the harmonic mean of the distances. The new point is allocated to the class with the minimum distance.

#### Value

# A list including:

ela A matrix or a vector (depending on the distance chosen) with the averaged over

all folds rates of correct classification for all hyper-parameters ( $\alpha$  and k).

performance The estimated rate of correct classification.

best\_a The best value of  $\alpha$ . This is returned for "ESOV" and "taxicab" only.

best\_k The best number of nearest neighbours.

runtime The run time of the cross-validation procedure.

Tuning of the projection pursuit regression for compositional data

Tuning of the projection pursuit regression for compositional data

# Description

Tuning of the projection pursuit regression for compositional data In addition, estimation of the rate of correct classification via K-fold cross-validation.

# Usage

```
compppr.tune(y, x, nfolds = 10, folds = NULL, seed = FALSE,
nterms = 1:10, type = "alr", yb = NULL )
```

# **Arguments**

У	A matrix with the available compositional data, but zeros are not allowed.
х	A matrix with the continuous predictor variables.
nfolds	The number of folds to use.
folds	If you have the list with the folds supply it here.
seed	If seed is TRUE the results will always be the same.
nterms	The number of terms to try in the projection pursuit regression.
type	Either "alr" or "ilr" corresponding to the additive or the isometric log-ratio transformation respectively.
yb	If you have already transformed the data using a log-ratio transformation put it here. Othewrise leave it NULL.

## **Details**

The function performs tuning of the projection pursuit regression algorithm.

# Value

A list including:

kl The average Kullback-Leibler divergence.

perf The average Kullback-Leibler divergence.

runtime The run time of the cross-validation procedure.

## Author(s)

Michail Tsagris.

R implementation and documentation: Michail Tsagris <mtsagris@uoc.gr>.

#### References

Friedman, J. H. and Stuetzle, W. (1981). Projection pursuit regression. Journal of the American Statistical Association, 76, 817-823. doi: 10.2307/2287576.

## See Also

```
comp.ppr,comp.reg,alfa
```

# **Examples**

```
y <- as.matrix(iris[, 1:3])
y <- y/ rowSums(y)
x <- iris[, 4]
mod <- compppr.tune(y, x)</pre>
```

## **Description**

This is a cross-validation procedure to decide on the number of principal components when using regression with compositional data (as predictor variables) using the  $\alpha$ -transformation.

# Usage

```
alfapcr.tune(y, x, model = "gaussian", nfolds = 10, \max k = 50, a = seq(-1, 1, by = 0.1), folds = NULL, ncores = 1, graph = TRUE, col.nu = 15, seed = FALSE)
```

### Arguments

У	A vector with either continuous, binary or count data.
X	A matrix with the predictor variables, the compositional data. Zero values are allowed.
model	The type of regression model to fit. The possible values are "gaussian", "binomial" and "poisson".
nfolds	The number of folds for the K-fold cross validation, set to 10 by default.
maxk	The maximum number of principal components to check.

A vector with a grid of values of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If  $\alpha = 0$  the

isometric log-ratio transformation is applied.

folds If you have the list with the folds supply it here. You can also leave it NULL

and it will create folds.

ncores How many cores to use. If you have heavy computations or do not want to wait

for long time more than 1 core (if available) is suggested. It is advisable to use it if you have many observations and or many variables, otherwise it will slow

down th process.

graph If graph is TRUE (default value) a filled contour plot will appear.

col.nu A number parameter for the filled contour plot, taken into account only if graph

is TRUE.

seed If seed is TRUE the results will always be the same.

#### **Details**

The  $\alpha$ -transformation is applied to the compositional data first and the function "pcr.tune" or "glm-pcr.tune" is called.

#### Value

If graph is TRUE a filled contour will appear. A list including:

mspe The MSPE where rows correspond to the  $\alpha$  values and the columns to the num-

ber of principal components.

best.par The best pair of  $\alpha$  and number of principal components.

performance The minimum mean squared error of prediction.

runtime The time required by the cross-validation procedure.

library(MASS)
y <- as.vector(fgl[, 1])
x <- as.matrix(fgl[, 2:9])
x <- x/ rowSums(x)
mod <- alfaper.tune(y, x, nfolds = 10, maxk = 50, a = seq(-1, 1, by = 0.1) )</pre>
```

Tuning the parameters of the regularised discriminant analysis

Tuning the parameters of the regularised discriminant analysis

## **Description**

Tuning the parameters of the regularised discriminant analysis for Eucldiean data.

## Usage

```
rda.tune(x, ina, nfolds = 10, gam = seq(0, 1, by = 0.1), del = seq(0, 1, by = 0.1), ncores = 1, folds = NULL, stratified = TRUE, seed = FALSE)
```

## **Arguments**

x	A matrix with the data.
ina	A group indicator variable for the avaiable data.
nfolds	The number of folds in the cross validation.
gam	A grid of values for the $\gamma$ parameter as defined in Tsagris et al. (2016).
del	A grid of values for the $\delta$ parameter as defined in Tsagris et al. (2016).
ncores	The number of cores to use. If more than 1, parallel computing will take place. It is advisable to use it if you have many observations and or many variables, otherwise it will slow down th process.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
stratified	Do you want the folds to be created in a stratified way? TRUE or FALSE.
seed	If seed is TRUE the results will always be the same.

#### **Details**

Cross validation is performed to select the optimal parameters for the regularisded discriminant analysis and also estimate the rate of accuracy.

The covariance matrix of each group is calcualted and then the pooled covariance matrix. The spherical covariance matrix consists of the average of the pooled variances in its diagonal and zeros in the off-diagonal elements. gam is the weight of the pooled covariance matrix and 1-gam is the weight of the spherical covariance matrix, Sa = gam \* Sp + (1-gam) \* sp. Then it is a compromise between LDA and QDA. del is the weight of Sa and 1-del the weight of each group covariance group. This function is a wrapper for alfa.rda.

## Value

A list including: If graph is TRUE a plot of the performance versus the number of principal components will appear.

per	An array with the estimate rate of correct classification for every fold. For each of the M matrices, the row values correspond to gam and the columns to the del parameter.
percent	A matrix with the mean estimated rates of correct classification. The row values correspond to gam and the columns to the del parameter.
se	A matrix with the standard error of the mean estimated rates of correct classification. The row values correspond to gam and the columns to the del parameter.
result	The estimated rate of correct classification along with the best gam and del parameters.
runtime	The time required by the cross-validation procedure.

Tuning the principal components with GLMs

Tuning the principal components with GLMs

## Description

Tuning the number of principal components in the generalised linear models.

## Usage

```
pcr.tune(y, x, nfolds = 10, maxk = 50, folds = NULL, ncores = 1,
seed = FALSE, graph = TRUE)

glmpcr.tune(y, x, nfolds = 10, maxk = 10, folds = NULL, ncores = 1,
seed = FALSE, graph = TRUE)

multinompcr.tune(y, x, nfolds = 10, maxk = 10, folds = NULL, ncores = 1,
seed = FALSE, graph = TRUE)
```

## **Arguments**

у	A real valued vector for "pcr.tune". A real valued vector for the "glmpcr.tune" with either two numbers, 0 and 1 for example, for the binomial regression or with positive discrete numbers for the poisson. For the "multinompcr.tune" a vector or a factor with more than just two values. This is a multinomial regression.
X	A matrix with the predictor variables, they have to be continuous.
nfolds	The number of folds in the cross validation.
maxk	The maximum number of principal components to check.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
ncores	The number of cores to use. If more than 1, parallel computing will take place. It is advisable to use it if you have many observations and or many variables, otherwise it will slow down th process.
seed	If seed is TRUE the results will always be the same.
graph	If graph is TRUE a plot of the performance for each fold along the values of $\alpha$ will appear.

## **Details**

Cross validation is performed to select the optimal number of principal components in the GLMs or the multinomial regression. This is used by alfaper. tune.

#### Value

If graph is TRUE a plot of the performance versus the number of principal components will appear. A list including:

msp A matrix with the mean deviance of prediction or mean accuracy for every fold.

A vector with the mean deviance of prediction or mean accuracy, each value corresponds to a number of principal components.

K The number of principal components which minimizes the deviance or maximises the accuracy.

Performance The optimal performance, MSE for the linea regression, minimum deviance for the GLMs and maximum accuracy for the multinomial regression.

runtime The time required by the cross-validation procedure.

```

#### **Examples**

```
library(MASS) x \leftarrow as.matrix(fgl[, 2:9]) y \leftarrow rpois(214, 10) glmpcr.tune(y, x, nfolds = 10, maxk = 20, folds = NULL, ncores = 1)
```

Tuning the value of alpha in the alpha-regression Tuning the value of  $\alpha$  in the  $\alpha$ -regression

## Description

Tuning the value of  $\alpha$  in the  $\alpha$ -regression.

## Usage

```
alfareg.tune(y, x, a = seq(0.1, 1, by = 0.1), nfolds = 10, folds = NULL, nc = 1, seed = FALSE, graph = FALSE)
```

## **Arguments**

У	A matrix with compositional data. zero values are allowed.
х	A matrix with the continuous predictor variables or a data frame including categorical predictor variables.
a	The value of the power transformation, it has to be between -1 and 1. If zero values are present it has to be greater than 0. If $\alpha=0$ the isometric log-ratio transformation is applied.
nfolds	The number of folds to split the data.
folds	If you have the list with the folds supply it here. You can also leave it NULL and it will create folds.
nc	The number of cores to use. IF you have a multicore computer it is advisable to use more than 1. It makes the procedure faster. It is advisable to use it if you have many observations and or many variables, otherwise it will slow down th process.
seed	If seed is TRUE the results will always be the same.
graph	If graph is TRUE a plot of the performance for each fold along the values of $\alpha$ will appear.

## **Details**

The  $\alpha$ -transformation is applied to the compositional data and the numerical optimisation is performed for the regression, unless  $\alpha=0$ , where the coefficients are available in closed form.

## Value

A plot of the estimated Kullback-Leibler divergences (multiplied by 2) along the values of  $\alpha$  (if graph is set to TRUE). A list including:

runtime	The runtime required by the cross-validation.
kula	A matrix with twice the Kullback-Leibler divergence of the observed from the fitted values. Each row corresponds to a fold and each column to a value of $\alpha$ . The average over the columns equal the next argument, "kl".
kl	A vector with twice the Kullback-Leibler divergence of the observed from the fitted values. Every value corresponds to a value of $\alpha$ .
opt	The optimal value of $\alpha$ .
value	The minimum value of twice the Kullback-Leibler.

```

## Description

Unconstrained log-contrast regression with compositional predictor variables.

## Usage

```
ulc.reg(y, x, z, xnew = NULL, znew = NULL)
```

## **Arguments**

У	A numerical vector containing the response variable values. This must be a continuous variable.
х	A matrix with the predictor variables, the compositional data. No zero values are allowed.
z	A matrix, data.frame, factor or a vector with some other covariate(s).
xnew	A matrix containing the new compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.
znew	A matrix, data.frame, factor or a vector with the values of some other covariate(s). If you have no new data, leave this NULL as is by default.

#### **Details**

The function performs the unconstrained log-contrast regression model as opposed to the log-contrast regression described in Aitchison (2003), pg. 84-85. The logarithm of the compositional predictor variables is used (hence no zero values are allowed). The response variable is linked to the log-transformed data without the constraint that the sum of the regression coefficients equals 0. If you want the regression model with the zum-to-zero contraints see lc.reg. Extra predictors variables are allowed as well, for instance categorical or continuous.

## Value

A list including:

be The constrained regression coefficients. Their sum equals 0.

covbe If covariance matrix of the constrained regression coefficients.

va The estimated regression variance.

residuals The vector of residuals.

est If the arguments "xnew" and "znew" were given these are the predicted or esti-

mated values, otherwise it is NULL.

x <- x / rowSums(x)
mod1 <- ulc.reg(y, x)
mod2 <- ulc.reg(y, x, z = iris[, 5])</pre>
```

## Description

Unconstrained log-contrast regression with multiple compositional predictors.

## Usage

```
ulc.reg2(y, x, z, xnew = NULL, znew = NULL)
```

## **Arguments**

У	A numerical vector containing the response variable values. This must be a continuous variable.
X	A list with multiple matrices with the predictor variables, the compositional data. No zero values are allowed.
z	A matrix, data.frame, factor or a vector with some other covariate(s).
xnew	A matrix containing a list with multiple matrices with compositional data whose response is to be predicted. If you have no new data, leave this NULL as is by default.
znew	A matrix, data.frame, factor or a vector with the values of some other covariate(s). If you have no new data, leave this NULL as is by default.

#### **Details**

The function performs the unconstrained log-contrast regression model as opposed to the log-contrast regression described in Aitchison (2003), pg. 84-85. The logarithm of the compositional predictor variables is used (hence no zero values are allowed). The response variable is linked to the log-transformed data without the constraint that the sum of the regression coefficients equals 0. If you want the regression model with the zum-to-zero contraints see <a href="loc.reg2">lc.reg2</a>. Extra predictors variables are allowed as well, for instance categorical or continuous. Similarly to <a href="loc.reg2">lc.reg2</a> there are multiple compositions treated as predictor variables.

## Value

## A list including:

be The constrained regression coefficients. Their sum equals 0. covbe If covariance matrix of the constrained regression coefficients.

va The estimated regression variance.

residuals The vector of residuals.

est If the arguments "xnew" and "znew" were given these are the predicted or esti-

mated values, otherwise it is NULL.

Unit-Weibull regression models for proportions

Unit-Weibull regression models for proportions

## **Description**

Unit-Weibull regression models for proportions.

## Usage

```
unitweib.reg(y, x, tau = 0.5)
```

## **Arguments**

tau

y A numerical vector proportions. 0s and 1s are allowed.

x A matrix or a data frame with the predictor variables.

The quantile to be used for estimation. The default value is 0.5 yielding the median.

## **Details**

See the reference paper.

## Value

A list including:

loglik The loglikelihood of the regression model.

info A matrix with all estimated parameters, their standard error, their Wald-statistic

and its associated p-value.

Zero adjusted Dirichlet regression

Zero adjusted Dirichlet regression

## Description

Zero adjusted Dirichlet regression.

## Usage

```
zadr(y, x, xnew = NULL, tol = 1e-05)
mixreg(param, z)
```

## **Arguments**

У	A matrix with the compositional data (dependent variable). The number of observations (vectors) with no zero values should be more than the columns of the predictor variables. Otherwise, the initial values will not be calculated.
X	The predictor variable(s), they can be either continuous or categorical or both.
xnew	If you have new data use it, otherwise leave it NULL.
tol	A tolerance level to terminate the maximisation process.
param	Some arguments passed on to the mixreg helper function.
z	Some arguments passed on to the mixreg helper function.

#### **Details**

A zero adjusted Dirichlet regression is being fittd. The likelihood conists of two components. The contributions of the non zero compositional values and the contributions of the compositional vectors with at least one zero value. The second component may have many different sub-categories, one for each pattern of zeros. The function "mixreg" is a helper function and is not intended to be called directly by the user.

#### Value

## A list including:

runtime	The time required by the regression.
loglik	The value of the log-likelihood.
phi	The precision parameter. If covariates are linked with it (function "diri.reg2"), this will be a vector.

be The beta coefficients.

seb The standard error of the beta coefficients.

sigma Th covariance matrix of the regression parameters (for the mean vector and the

phi parameter) in the function "diri.reg2".

est The fitted or the predicted values (if xnew is not NULL).
